## Preface

**Dr. Bruno Lanvin**

Nearly two years after the onset of COVID-19, one conclusion is clear—digital transformation has changed from a needed priority into a global imperative for all. Businesses, governments, education institutions, and individuals all rapidly shifted their processes online in the wake of lockdown measures. The overnight shift towards virtual living and working heightened our reliance on digital technologies and increased the demand for network infrastructure, reliable connectivity, and digital literacy.

The great digital acceleration came as a boon for emerging markets as it pushed forward the digitalization of their economies by several years. The need for digital technologies forced emerging market businesses to move online, evidenced by the explosion in digital startups and unicorns (in September 2021, reports indicate that India registered more than 66 unicorn companies, with around 28 created in the first nine months of 2021 alone) (Business Today India 2021). Other emerging markets that historically lagged in digitalization also progressed (with the number of unicorns in

**Prof. Soumitra Dutta**

Latin America growing from 2 to 34 in four years, with 60% of them being based in Brazil) (Pompeo 2021).

Amid such digital acceleration, it is sobering to note that more than 40% of the world's population today does not have usable access to the Internet. Numerous nations are still unable to access the full advantages of digital technologies due to ongoing developmental challenges, structural limitations, and fragmented regulatory environments. High-income economies with more digital skills and greater access to resources continue to leverage technology better than lower-income nations that have limited skills and access to fewer resources. Divisions across rich and poor regions within national boundaries have deepened as rural populations and less well-off segments of society struggle to move their productive work online. As a result, the economic and social benefits of accelerated digital transformation do not distribute equally across the globe but remain concentrated geographically in certain economies and specific segments of society.

Such divides to access signal how important it is to shape the process of post-COVID global recovery in a way that benefits all members of society. For example, examining the role of different stakeholders (governments, businesses, and citizens) towards informed policy decisions can help demonstrate methods that take advantage of technological innovation. Any change will require accurate facts and metrics that measure how different nations can address recovery issues and determine what methods can use improvements.

The need for data and actionable insights towards network readiness and digital innovation offered the precise reason for the first Network Readiness Index (NRI) 20 years ago, and it is the very reason why the index is more relevant now than ever.

The NRI 2021 is the third edition of the updated model that addresses trust, governance, inclusivity, and the potential impact on Sustainable Development Goals (SDGs). We have introduced additional indicators for two reasons: first, to better capture the reach and impact of digital transformation, and second, to offer a holistic view of how technology use can enhance the development and competitiveness of economies.

It is now time to look ahead beyond the crisis and create a more equitable and inclusive post-pandemic world. In all likelihood, such an investigation could lead to more questions than answers:

- How do we distribute the benefits of technology with more equality across the world?
- How do we ensure that adequate investments are made in infrastructure, access, and skills so that all can benefit from the opportunity of hybrid learning and working?
- What will the future models of business look like?

- How will work-life balance shift for employees?
- How will the pandemic affect globalization processes?
- How will the crisis impact the environment and sustainable development?
- These questions are important to ask, and the NRI aims to provide valuable evidence to support decision leaders as they attempt to solve many of the listed issues.

We would like to express our gratitude towards Sterlite Technologies Limited (STL), the sponsor and knowledge partner for the NRI for the past two years. We are grateful for the continuous support and active participation of our partners, the Advisory Board, and the NRI Technical Advisory Group. We give additional thanks to the Joint Research Centre (JRC) for ensuring the accuracy of our metrics and findings. We also invite your comments and feedback as we strive to continuously improve the NRI and keep it the most relevant global index and set of measures for technology policy creation.

---

### It's time to cross the bridge of digital inequality

Ankit Agarwal,

**Managing Director**

STL - Sterlite Technologies Limited

The last few months have shown us two sides of the digital landscape. On the one side, a new world has emerged where the Internet has brought people closer than ever and redefined the way we work, live and interact. The pace of digital transformation fastened like never before and enabled business continuity across the globe, saving millions of jobs. On the other side, unfortunately, is the exposed wide chasm between the connected and the unconnected. While more than 2 million people are coming online each day, millions are left behind without digital solutions, tools, and services. The digital divide is not only across countries but regions, societies and genders. There is now a more pressing need than ever to eliminate these inequalities and bring everyone on the right side of the digital revolution.

STL - Sterlite Technologies Limited is excited to collaborate with Portulans Institute for the Network Readiness Index Report 2021 that will put a microscopic lens on the rapid digital transformation across the globe and examine the strategies by several countries to cope with or leverage the accelerated technology adoption to ensure larger digital inclusion. For close to three decades, STL is relentlessly bringing together disruptive solutions and models that have led to digital inclusion, empowering economies across the globe. The company is solving the crucial problem of at scale, viable and ubiquitous connectivity by

powering a new network architecture driven by advanced optical technologies with a layer of programmability to manage the ever-increasing traffic.

In its 14th version and third edition under a renewed methodology, the NRI report reflects how technology and people need to be integrated within an effective governance structure to have the right impact on our economy, society and the environment. In the 2021 edition, the report helps dissect how economies embraced digital transformation, thus laying down a detailed roadmap for governments to launch and accelerate a digital journey that provides equal economic and social benefits for all. It will cover various aspects such as the development of ICT infrastructure, regulatory frameworks, community initiatives among others.

The world stands at an interesting stage in its evolution. The impact of technology now is greater than ever and digitalization is fundamentally changing our lives. For the world to collectively grow, the stakeholders - economies, businesses and societies - will have to step up and embrace digital technologies at a faster pace. The NRI report unearths the opportunities and challenges that lie ahead in making that happen. Let's make the most of this opportunity to take the wonders of technology to the last standing person on the planet.

# Shaping the Global Recovery:

How digital technologies can make the post-COVID world more equal.

# Shaping the Global Recovery

**Soumitra Dutta, Bruno Lanvin, Rafael Escalona Reynoso, Mariam Chaduneli, Sylvie Antal and Abdellah Bouhamidi**

## The great acceleration

The COVID-19 pandemic created a global tipping point in regards to the adoption of technology. In the first half of 2020 over a matter of weeks, practically all countries (both developed and developing) adopted strict lockdowns and required most organizations to employ remote working. As a result, the world witnessed a digital acceleration with a scale and magnitude few would have imagined possible a couple of years ago.

Executives surveyed by McKinsey noted how the pandemic accelerated the digitalization of customer and supply-chain interactions in addition to their company's internal operations by three to four years (Laberge, Clayton, Snider and Smaje 2021). The rapid growth by tech giants in the past year further reflects the sheer scale of digitalization during the COVID pandemic: The New York Times noted that the five tech superpowers (Amazon, Apple, Google, Microsoft, and Facebook) earned a combined revenue of about \$1.2 trillion in 2020, a 25% increase compared to pre-pandemic levels (Ovide 2021).

The COVID-19 pandemic occurred at a point in time when many digital technologies had already matured and could rapidly deploy on a large scale. Companies commonly used remote teams before the pandemic in an attempt to globalize their operations. Organizations had implemented flexible office practices and open office plans to support collaboration, adjusted hours, and an enhanced work-life balance. Once the effects of lockdown took place, many businesses could move with relative ease into fully remote or hybrid work environments. The technology had matured to handle such requirements, and employees had the necessary experience with collaborative software systems to continue remote work.

While many organizations reported no loss of productivity due to remote working during the pandemic period, the potential for remote work remains higher in advanced economies compared to emerging economies where physical and manual jobs in sectors like agriculture and manufacturing remain more prevalent (McKinsey Global Institute, 2020).

Some emerging countries took advantage of the new normal to accelerate their own digital transformation, but other economies struggled against the exposure to new kinds of digital divides. While the COVID-19 pandemic has adversely affected several groups (e.g. women and minorities), the increased reliance on digital technologies forced businesses in emerging markets to move their operations online, spawning an explosion in digital startups and unicorns. In September 2021, reports indicate that India registered more than 66 unicorn companies, with around 28 created in the first nine months of 2021 alone (Business Today India 2021). Digital companies now make up a significant part of the equity markets in emerging economies—for example, new companies now make up more than 60% of the China MSCI index (Business Today India 2021).

Over the past two years, the COVID-19 pandemic helped create a real-time economic revolution fueled by digital transformation. Digital technologies provided effective solutions that could assess the overall effect and scope of the pandemic, and many products and services moved online. For example, the digital tools companies used out of necessity gave organizations a deeper understanding of supply-chains and consumer trends, leading to enhanced contact tracing, contactless product delivery, and remote services. At a broad level, COVID-19 charted the way for accelerated digitization programs that supported business continuity throughout the crisis.

The data-based recovery effort now presents a chance for governments to play a critical role that could pave the way for new technologies and infrastructure. The shift towards greater

# Shaping the Global Recovery

technological integration is an opportunity to develop plans and policies that promote a more equitable benefit share, and the outcomes that stem from technology can help to build a better and more connected future. As societies usher in this new era of accelerated digital transformation, each economy must consider whether global inequalities concerning technology access and usage will subside or continue to expand. The ability to leverage the current digitized climate can lead to timelier and more precise data, informed decision-making processes, and better livelihoods.

## Reducing digital divides: a trend reversed?

Before the COVID-19 pandemic onset, positive trends in technological adoption across the globe gave reason for optimism concerning the reduction of digital divides. However, when COVID-19 broke out and an increased reliance on digital technology swept through the global economy, the positive trends partially reversed, giving renewed importance to existing divides while creating new ones.

Amid the digital euphoria, it is sobering to note that more than 40% of the world's population does not currently have usable access to the Internet (ITU 2020). Numerous nations can not access the full advantages of digital technologies due to ongoing developmental challenges, structural limitations, and fragmented regulatory environments. High-income economies with more digital skills and greater access to resources continue to leverage technology better than lower-income nations that have limited skills and access to fewer resources. Such a divide is of particular importance for developed states that struggled to ensure the standard well-being of their citizens (e.g. food supply) throughout the height of the pandemic. Divisions across wealthy and poorer regions within national boundaries further deepened as less well-

off and rural populations struggled to shift their productive work online. The economic and social benefits of accelerated digital transformation are not distributed equally across the globe but remain geographically concentrated in certain economies and specific segments of society.

Physical distancing requirements put in place due to the COVID-19 pandemic also resulted in a shift towards the digitalization of daily tasks such as: accessing news and information, shopping, staying connected to friends and family, receiving medical treatment, attending school, and using financial services. Such an alteration in the methods of daily activities has created new digital divides along the way.

Given the pervasiveness of digital transformation, it is important to determine the obstacles to digital access and usage in different regions of the world. Barriers such as geographical restrictions, lack of physical infrastructure, and digital illiteracy contribute to the digital divide and are often faced at disproportionate levels by marginalized populations. Governments, private companies, and not-for-profit organizations can take steps to help bridge the current gaps and increase access to digital technologies for such groups, ensuring that the outcomes disseminate evenly.

The acceleration of digital transformation also highlighted how divides of access exist between genders, in addition to regions and economies. The digital gender divide remains one of the primary barriers to meaningful participation in a digital society, and the COVID pandemic affected further polarization. Crisis-induced digitalization uncovered gender gaps in Internet access, digital skills, participation in STEM fields, and innovation leadership (Brookings Institute 2021). According to the International Telecommunication Union's latest data, the proportion of women using the Internet globally amounts to 48% compared to 55% of men (ITU 2021). In relative terms, the global Internet use gender gap stands at 12.5%. The divergence between genders is

# Shaping the Global Recovery

even more pressing in developing countries, where women are 22.8% less likely than men to use the Internet, although it is not an exclusive issue (Brookings Institute 2021).

Equal access to digital technologies and skills is a step towards gender equality within the context of the Sustainable Development Goals as outlined by the United Nations. The BBC notes that while activities have moved online, women and girls globally are left out because they have lower levels of access to the Internet (Fitzgerald 2021). The growth of such a digital divide across gender also has secondary effects; with regions where women suffer from reduced rights to land or access to the job market, the added dimension of increased digital inequality continues to make matters of equality worse.

Identifying and addressing the inequalities in both access and literacy through targeted measures is a crucial strategy that can further promote inclusive and sustainable digital-driven growth. Such preparedness could derive into positive ramifications like those experienced during the pandemic, with possible longer-term impacts on economic development, employment, food security and health, government services provision, and the quality of life (UNCTAD 2021).

## Can technology be a post-COVID equalizer?

Both emerging and developed economies have shown initiative to help close the digital divide and promote more distributed access to digital technologies. The experience of some of the leading NRI economies, namely the United States and Sweden, shows that supporting local, community-tailored initiatives can often have a positive impact. For instance, the Swedish municipalities could select subsidies that encouraged the faster development of ICT infrastructure, allowing residents to connect to high-speed Internet. As a result, the Swedish population

with broadband access grew from 2% to 89% between 1995 and 2012 (Münch 2013).

South Korea, China, the United Kingdom, and the United States demonstrated further leadership efforts to promote Internet connectivity via initiatives such as satellite Internet and 5G. Satellite Internet projects have since impacted the connectivity experience and accessibility of videoconferencing and other data-intensive apps, while 5G helped reach rural areas where the geographical landscape makes laying fiber optic cable difficult. To accelerate the arrival of 5G, the United Kingdom set up a £200 million fund that aims to improve the opportunities UK businesses' have to develop 5G technology for domestic and global markets in a range of geographical and vertical market segments (KPMG 2019). The communications regulator received recommendations from the government to appraise flexible licensing models for spectrum sharing, a way for new players to access spectrum and invest in new business models. In South Korea, the government incentivized cooperation and encouraged network sharing between mobile network operators (MNOs) by promising tax benefits and security maintenance services (KPMG 2019). As a result, three MNOs simultaneously launched an initial limited 5G service, started to share existing network assets, and jointly built new 5G facilities.

The shift towards remote learning brought attention to existing gaps in infrastructure and connectivity that rural or underserved regions continue to face. An estimated 463 million students around the globe are unable to access remote learning due in part to fragmented policy approaches to education and low levels of equipment access for home learning (UNICEF 2020). Various economies took novel approaches towards providing inclusive remote learning opportunities for students while schools remain closed (World Bank 2020). For example, Pakistan began using its national terrestrial television programs to deliver educational content to

# Shaping the Global Recovery

rural areas(Aijaz 2020). Students unable to take advantage of the program may soon gain access through mobile platforms, an initiative currently in development through a public-private partnership. The United States implemented a support subsidy for broadband services and specific devices to help low-income households stay connected during the COVID-19 pandemic (FCC 2021).

Since the onset of the COVID-19 pandemic, the top priority of many countries involved increasing public access to critical supplies and medical services. As a result, it is arguable that digitalization in the healthcare sector incited rapid innovation in 2020 more than any year before (UNCTAD 2021). In Tanzania, the Ministry of Health partnered with the e-Government Authority and all mobile networks to provide free information and calls to health experts through a short code number dedicated to COVID-19 (UNDESA 2020). The service provides preliminary diagnoses to citizens according to their locations and other personal data. In Luxembourg, the government developed an online sales platform that offers home

delivery of necessities to all citizens, with a specific portal for persons from high-risk categories such as seniors, those with chronic diseases, and the immunocompromised (The Luxembourg Government 2021).

The COVID-19 pandemic also altered consumer behavior. For large sectors of society, shopping experienced a drastic evolution as many online consumer processes initiated due to restrictions became permanent because of their lasting convenience. As an example, the online retailer Amazon reported a more than 200% increase in profit (Weise 2021). The shift towards online shopping did cause some adverse effects for small or family-owned businesses that sometimes lack the necessary tools or skills to pursue digital business channels. As a result, several countries implemented transitioning programs to assist with the evolution of e-commerce. In Chile, the Ministry of Agriculture promoted family farming programs through a digital platform (UNDESA 2021). Similarly, Ghana set up an e-commerce platform that connected 10,000 farmers with buyers, a digital infrastructure that helped boost production prices (UNDESA 2021).

# Shaping the Global Recovery

## Box 1: The human dimension of technological innovation during the COVID-19 crisis.

Digital technologies constitute a dynamic and highly interdependent ecosystem that requires a continuous combination of communication infrastructure, connectivity, and skills. The rapid shift towards an increased reliance on technology is causing significant social, economic, and political changes that require recognition and must be addressed in a way that benefits society.

Frontier technologies like robotics and Artificial Intelligence (AI) have significantly increased the efficiency and capabilities of the healthcare sector, in addition to better access for populations. The European Union funded the deployment of AI software called InferRead™ CT Lung COVID-19, a solution that analyses images of the lungs taken by a CT scanner and identifies the signs of Coronavirus within seconds. Since the outbreak of the Coronavirus pandemic, the InferRead™ artificial intelligence tool analyzed over 20,000 CT scans, speeding up the testing process and revolutionizing how radiologists work.[i] Besides facilitating rapid diagnostics through AI and PCR tests, the technology enabled the accelerated development of vaccines. Technology played a crucial role at all stages of the process and was utilized in the sequence data on the SARS-CoV-2 genome, bioinformatics, computational approaches, and structural modeling that

helped identify appropriate antigen targets.[ii]

The increased prevalence of digital tools such as e-commerce platforms, resource management, and collaboration software has helped small businesses and startups leverage their networks and employees. For example, Tele-health services are now able to reach a higher number of those in need of medical care. Software tools provide better access to critical information about markets for business products and can improve company production planning and commercialization. In the public sector, investment in civic technologies has increased citizen participation and government responsiveness and transparency. Some nations used digital services to streamline contact tracing, COVID-19 screening, and testing. Others have even applied digitization to revolutionize how residents can apply for financial assistance and subsidies.

# Shaping the Global Recovery

## The crucial importance of recovery packages

During the pandemic, major economies rapidly freed themselves from budgetary and fiscal orthodoxies and used public debt as a tool to maintain employment and social cohesion levels in the face of lockdown and other contention measures. Since the onset of the crisis, global fiscal support amounts have reached more than 12 trillion USD as countries progressively mobilize massive recovery packages (OECD 2021). The United States passed three major spending packages over the past two years, totaling nearly 5 trillion USD (Committee for a Responsible Federal Budget 2021). The European Union set a long-term budget of 2.018 trillion EUR under its NextGenerationEU recovery instrument to help repair the economic and social damage caused by the Coronavirus pandemic (European Commission 2021). The EU also used the stimulus to aid the transition towards a modern and more sustainable Europe between 2021-2027. In late 2020, Japan unveiled a \$708 billion economic stimulus designed to accelerate the pandemic recovery, bringing its combined value of COVID-19-related spending to about \$3 trillion (Kihara, Kajimoto 2020). Meanwhile, Brazil's \$50 billion stimulus package, passed at the beginning of the crisis, remains one of the largest among emerging markets.

Four primary areas are likely to receive the bulk of such fiscal efforts:

- 1. Health:** Since the medical issues of the pandemic are still visible and highly sensitive, continued funding is in order for vaccines and other treatments, in addition to a re-hauling of national health systems. Efforts to reduce dependencies on external supplies (including low-tech supplies such as masks, oxygen, or syringes) are necessary as part of a global reflection on improving international supply chains and local resilience.
- 2. Greening of the economy:** In tune with the latest international commitments (including at the UN Climate Change Conference - COP 26 - in Glasgow), efforts to enhance an economy's national willingness and capabilities to fight climate change are at the core of many recovery packages (for instance, in the European Union). The significant reduction of economic activity during the pandemic showed the potential impact that lower levels of production and consumption could have on the environment, in addition to the economic and social cost reduction.
- 3. Infrastructure:** In large economies with aging infrastructure, the notion of "building back better" has focused on modernization. Evidence of such recovery plans are visible within the US recovery package adopted by the US Congress in November 2021. Infrastructure is typically an area in which labor intensity is higher than in the rest of the economy, and such packages should act in a truly Keynesian way (TVA-style) to fight longer-term unemployment.
- 4. Digital transformation:** Moving digitization from a "priority" to an "imperative" measure is the central common component of many economic recovery packages. The experience gained during the pandemic (including teleworking, virtual teams, and virtual collaboration) opened new doors and perspectives. As the fourth axis, digital transformation cuts across the first three areas connected with recovery. Health policies and medical research can benefit from better use of technologies in hospital management and fundamental research. Recent applications of AI to genetic engineering have brought further credibility to such an approach. Similarly, technologies can enhance our abilities to build and manage better infrastructure (i.e. energy, transport, and communications), while digital transformation is clearly called to play an increasingly important

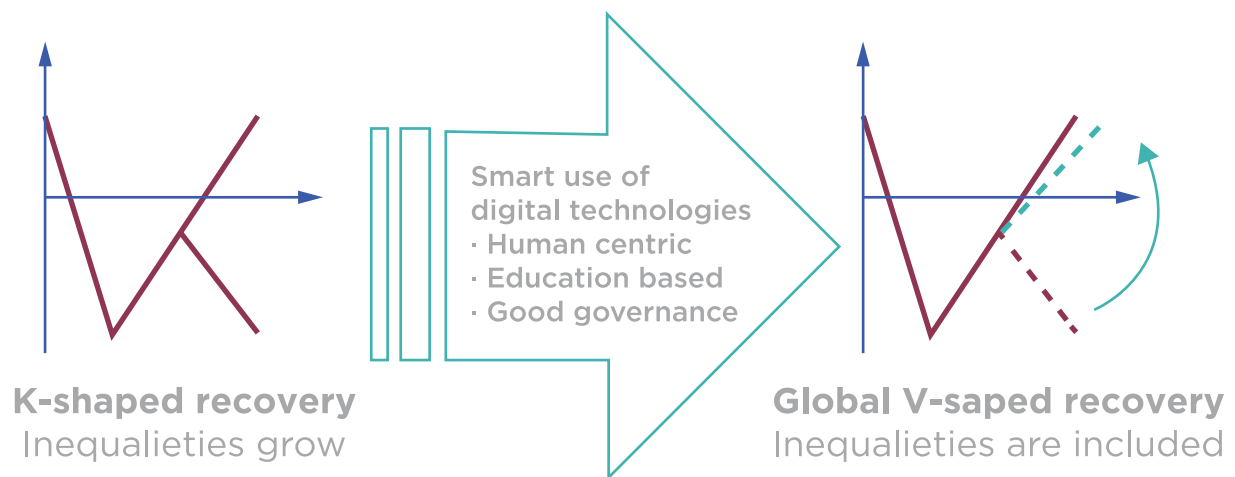

# Shaping the Global Recovery

role in our ability to address and mitigate the effects of climate change.

Beyond the applications of fiscal spending, it is important to consider how technology

can help further shape the process of a post-COVID global restoration. At the moment, recovery remains K-shaped, but we can still turn the “K” into a “V” (Figure 1).

**FIGURE 1:** MAKING THE CASE TO CHANGE THE K INTO A V

# Shaping the Global Recovery

Many signs suggest that the current recovery is both strong and rapid, but collected data also indicates that such a recovery may be unequal, both domestically and internationally. Domestically, some occupations will remain in high demand, especially in digitally-intensive activities. Others will face reduced appeal from labor markets, giving rise to the K-shaped recovery. Workers with minimal skill concerning digital technologies are at particular risk. Internationally, a similar phenomenon has emerged, whereby poorer (and under-networked) economies are at risk of finding themselves in the lower branch of the potential K-shaped global recovery.

The smart use of technology is a crucial aspect towards turning the K-shaped recovery into a V-shape, helping create an inclusive and global recovery process. Such technology use must remain human-centric, with particular efforts in education (upskilling and reskilling, lifelong training) and governance (balancing the interests of business with those of social and longer-term economic strategies).

## The NRI as a barometer of ongoing change

The Networked Readiness Index (NRI) was first published in 2002 by the World Economic Forum as part of the Global Information Technology Report. Over the last two decades, the NRI has provided a holistic view of how economies can deploy technology to enhance development and global competitiveness.

The NRI is the first technology framework to explicitly include the importance of governmental and societal factors in the formulation of digital strategies. In a major redesign of the NRI framework in 2019, current topical concerns of trust, governance, inclusivity, and impact on SDG goals were included in the model. The NRI framework continues to provide a simple yet holistic view of how economies can leverage the

power of digital technologies while building sustainable and inclusive futures.

For this year's report, the NRI reviews some of the effects induced by the COVID-19 pandemic that contributed to the new pace and depth of digital transformation. Although it is early to predict the full impact of the digital change induced by COVID-19, the NRI provides a first glance at the potential significance of accelerated digital technologies on governments, businesses, and individuals. The data from the NRI analysis examines how economies have dealt with and continue to fare in the face of present-day challenges. Promising initiatives are visible across several regions, including enhancements to the quality and timeliness of information and efforts to improve digital literacy and digital skills. The information presented by the NRI can help determine the proper courses of action to ensure that the economic and social benefits of this enhanced digital revolution are distributed equally across the globe.

# Key Messages

## NRI 2021

## Key messages from the NRI 2021

### 1. The pandemic turned digital transformation from a priority into a global imperative.

Over the past two years, the COVID-19 pandemic increased our dependence on technology and accelerated the inevitable process of digital transformation as many aspects of life moved online. The shift towards improved technological capability and integration presents an opportunity to build a better and more connected future in light of the “new normal”. However, as societies usher in the new era of accelerated digital transformation, it is important to consider whether global inequalities concerning technology access and usage will subside or continue to expand. The swift shift towards an increased reliance on technology has caused recognizable social, economic, and political changes that will have a lasting impact.

### 2. The new landscape of digital transformation is creating new divides that question the previous progress made towards reducing older gaps between distinct groups.

Divides in access exist not just between regions and economies but also remain persistent between genders. The digital gender divide continues to present a significant barrier to meaningful participation in a digital society, a barrier exacerbated by the effects of the pandemic. The rapid digitalization triggered by the COVID-19 pandemic uncovered gender gaps in Internet access, digital skills, participation in STEM fields, and innovation leadership (Brookings Institute, 2021). Equal access to digital technologies and skills is a step towards gender equality within the context of the Sustainable Development Goals. Greater inclusion of women and girls in these spaces can have far-reaching effects as it will encourage further participation in educational, economic, and entrepreneurial opportunities.

### 3. Technology can help equalize the global recovery.

As a growing number of large economies adopt massive stimulus and fiscal packages, anticipating the shape that the global recovery will form becomes easier. Four primary areas emerge as likely to receive the bulk of such recovery efforts:

**a. Health:** Since the effects of the pandemic are still highly visible and sensitive, funding for vaccines and other treatments, in addition to the re-hauling of national health systems, will be in order.

**b. Greening of the economy:** National economy’s willingness and capabilities to fight climate change will likely increase.

**c. Infrastructure:** Labor-intensive employment in infrastructure could help combine nation priorities to fight unemployment and ‘rebuild better’.

**d. Digital transformation (of organizations and societies).** Out of all four recovery aspects, digital transformation cuts across and impacts each of the first three.

If local and global inequalities start to grow again, it could diminish the long-term impact and sustainability of such stimulus packages. Fully leveraging technology and international cooperation should be top priorities for national economies as equalizing factors in the post-COVID recovery process (turning a K-shaped recovery to a global V-shaped one).

### 4. Network readiness requires holistic approaches.

The leading countries in network readiness have balanced, dynamic economies that excel in multiple areas and demonstrate strong performances across all pillar dimensions of the NRI. Similar to previous years, seven of the top 10 overall ranking economies also rank in the top 10 in at least three of the four primary NRI pillars. Performance trends demonstrate the importance of adopting a holistic

# Key Messages

approach towards advancing network readiness, as the four primary pillar areas are interdependent and reinforce each other. For example, as new technologies emerge during this era of digital transformation, factors such as governance and regulation (as well as mechanisms for disseminating these technologies among individuals, businesses, and governments) must keep pace. As the new digital economy becomes more established, the ability to integrate people and technology within the proper governance structures is key to fostering resilience and sustainability.

**5. Technology readiness remains fair at the regional level.** Although economies in higher-income region clusters remain the most network-ready, some of the most noteworthy efforts in overall performance identified this year are among the African countries of the middle and lower-income groups. Economies like South Africa (70th), Rwanda (101st), Nigeria (103rd), Mali (118th), and Madagascar (120th) display performances in certain NRI dimensions that are at par or even above some economies in the more developed regions of Asia and the Pacific, the Arab States, and Europe. In particular, economies that outperformed expectations showed higher prowess in governance, people, and technology. Still, this trend is less clear regarding impact, evidencing some of the pressing issues often endemic to emerging economies.

**6. Clear digital technology champions are helping bridge income group gaps.** China (29th), Ukraine (53rd), Vietnam (63rd), India (67th), and Rwanda (101st) are a few of the economies that continue to close the performance gap between income groups. China is the only upper-middle-income group economy that approached the cluster of high-income group economies featured in the top 25. In particular, China's output in

areas of digital technology associated with people and impact is above the high-income group median performance. Similarly, Ukraine (a lower-middle-income group economy) stands out with a performance above the mean of the upper-middle-income group in all four primary pillars of network readiness (Technology, People, Governance, and Impact). Lower-middle-income group peers Vietnam and India display similar results in technology and impact, while Rwanda (a low-income group economy) closes the gap with the lower-middle-income economies when it comes to governance.

**7. Connectivity is not an end in itself - it is a tool designed to create value for societies.** Even among regions that have achieved Internet connectivity, barriers such as the speed of connection, availability, affordability of connected devices, and fragmented regulatory environments persist, barring individuals from leveraging the power of digital technologies to create economic and social value. While connectivity is critical, it is also important to go beyond and focus on additional aspects such as education (to improve skills and support content creation) and policies that support technological investments and innovation in businesses, both small and large. Lastly, it is crucial that economies tackle the digital divide to ensure Internet access contributes to equal opportunity, rather than becoming a means that increases social and economic inequality.

# Key Results of NRI 2021

# Key Results

## The Top 10

Compared to previous years, the ranking of the top 10 performers in the NRI 2021 experienced some significant shifts in its composition. While the countries within the top 10 remain the same, specific countries made notable movements within the upper group. In particular, the Netherlands climbed three spots to take the top position from Sweden, which has held the number one position since 2019. The United States also shifted, increasing four rankings to earn a place among the top five for the first time in the 2019-2021 period. With Singapore falling out of the top five, four out of the five most network-ready economies in 2021 are from Europe.

The top 10 performers all demonstrate solid performance metrics across the highest

number of dimensions of the NRI. They all rank as the top 20 countries on each of the four primary pillars (Technology, People, Governance, Impact) and on at least two-thirds of the twelve sub-pillars. In particular, top performers rank well on the prominent indicators of Future Technologies, Economy, and Trust. All of the top 10 countries are high-income economies characterized by significant investment in emerging technologies and successful adoption of information and communications technologies (ICTs) by governments, businesses, and individuals. In terms of regional distribution, Europe leads with eight top ten countries, while Singapore and the United States represent the only economies located in Asia and the Pacific and the Americas, respectively.

TABLE 1: TOP 10 PERFORMERS IN NRI 2021

Economy	NRI Rank	NRI Score	PILLARS			
			Technology	People	Governance	Impact
Netherlands	1	82.06	3	7	2	3
Sweden	2	81.57	4	4	5	2
Denmark	3	81.24	7	2	3	7
United States	4	81.09	1	5	7	16
Finland	5	80.47	10	3	4	5
Switzerland	6	80.20	2	12	11	6
Singapore	7	80.01	8	9	12	1
Germany	8	78.95	5	8	13	10
Norway	9	78.49	13	6	1	11
United Kingdom	10	76.60	6	16	14	9

# Key Results

## Regional Leaders

The top three countries in each region capture the performance divide that exists among different regions. Europe continues to lead with four countries in the global top five, while Africa remains the most laggard

regional group. The Netherlands is the top performer in Europe as well as the top performer in the overall NRI rankings. The United Arab Emirates, Singapore, the Russian Federation, and the United States continue to lead in their respective regions. South Africa earned the top position in Africa this year.

**TABLE 2: NRI 2021 TOP 3 COUNTRIES BY REGION**

Africa	Arab States	Asia & Pacific	CIS	Europe	The Americas
1. South Africa (70)	1. United Arab Emirates (34)	1. Singapore (7)	1. Russian Federation (43)	1. Netherlands (1)	1. United States (4)
2. Mauritius (71)	2. Saudi Arabia (40)	2. Korea, Rep. (12)	2. Ukraine (53)	2. Sweden (2)	2. Canada (11)
3. Egypt (77)	3. Qatar (42)	3. Australia (13)	3. Armenia (60)	3. Denmark (3)	3. Chile (44)

Note: Global ranks in parentheses. CIS = Commonwealth of Independent States.

Source: Network Readiness Index Database, Portulans Institute, 2021.

## Income group leaders

The top performers of each income group reflect the strong correlation between income levels and network readiness present in the NRI 2021. High-income groups dominate the top quartile and earn the top three spots in the overall index ranking. China is the only country in the upper-middle-income group economies to rank in the upper quartile. Ukraine and Vietnam are the only lower-middle-income economies that make it into the upper half of the NRI rankings.

China (ranked 29th) and India (ranked 67th) experienced a performance boost this year in part from more precise measurements (for more details, see the next section Continuing to improve the NRI model on page ) and due to their advanced tech sectors. Both countries are home to some of the most innovative global businesses and organizations. Of note, both China and India have a network readiness greater than expected from their income levels upon final analysis.

**TABLE 3: NRI 2021 TOP 3 COUNTRIES BY INCOME GROUP**

High-income	Upper middle-income	Lower middle-income	Low-income
1. Netherlands (1)	1. China (29)	1. Ukraine (53)	1. Rwanda (101)
2. Sweden (2)	2. Malaysia (38)	2. Viet Nam (63)	2. Tajikistan (111)
3. Denmark (3)	3. Russian Federation (43)	3. India (67)	3. Gambia (113)

Note: Global ranks in parentheses (Detailed results can be found in next section).

Continuing to improve the NRI model

The pace of digital transformation demands a continual reexamination of the sources that enrich the NRI model. Similar to the renewal process of 2019, the NRI team examined multiple general and technology-specific sources to identify novel indicators that can help measure and assess the dynamic landscape of digital transformation and network readiness.

Improvements to the NRI occurred through the replacement, development, or inclusion of coherent metrics, but the main concept underlying the NRI model remained constant.

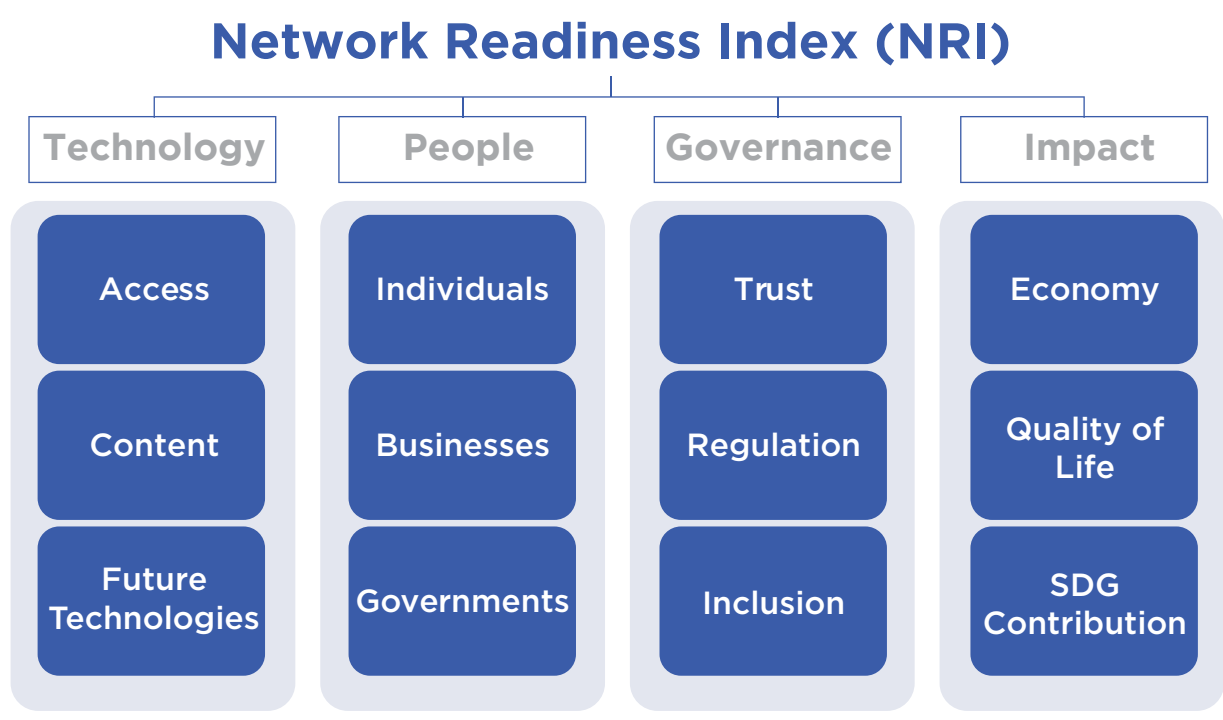

Improvement relies on the notion that our collective future will require a harmonious integration of People and Technology. As Technology continues to evolve, its

interaction with People will increase, and both Technology and People will collaborate as partners on both social and business planes. To ensure the effectiveness of such integration, implementing appropriate governance mechanisms that address issues related to trust, security, and inclusion must continue. The ultimate objective for the improvement of technology is threefold:

- 1. To have a positive impact on the economy
- 2. To have a positive impact on a country's quality of life
- 3. To help a country achieve all Sustainable Development Goals (SDGs)

Each of these objectives reflects the goals agreed upon by the United Nations for a better and more sustainable future.

FIGURE 1: THE NRI 2021 MODEL

Source: Network Readiness Index Database, Portulans Institute, 2021.

## The Network Readiness Index

For the 2021 NRI Report, three primary principles defined by the NRI Technical Advisory Group in 2019 once again serve as a guideline to keep the NRI model future-proof:

1. To maintain continuity with the major components of the NRI from previous years.
2. To reflect the current issues concerning ICT deployment that the NRI model of 2016 or previous models did not capture adequately.
3. To future-proof the NRI model regardless of developing future technology trends.

The NRI 2021 model reflects its staple four-pillar structure: Technology, People, Governance, and Impact. Each pillar consists of three sub-pillars depicted in Figure 1.

The structure of the pillars and sub-pillars of the NRI model deserves an in-depth explanation<sup>1</sup>.

## Technology

Technology is at the heart of the network economy. Therefore, as a primary category of the NRI, the Technology pillar seeks to assess the level of technology that is a *sine qua non* for a country to participate in the global economy. Three sub-pillars accomplish the Technology pillar's purpose:

- Access: The fundamental access level to ICT in countries, including issues

about communications infrastructure and affordability.

- Content: The type of digital technology produced in countries and the content/applications that can be deployed locally, including research on the subject derived from scientific and technical articles.
- Future Technologies: The extent that countries have prepared for the future of the network economy and new technology trends such as Artificial Intelligence (AI) and the Internet of Things (IoT).

As expected, large economies and tech hubs dominate both top 10 rankings. The United States reports the highest number of GitHub commits by far, followed by Germany, China, and the United Kingdom. As for cities, London saw the most frequent GitHub commits, accounting for more than two-fifths of the total in the country, followed by New York and San Francisco.[iii]

The results echo some of the central findings in this year's NRI report, suggesting a divide between outcomes from economies among higher-income groups and countries/cities located in the middle and lower-income groups. When it comes to economies, surprisingly, those in Africa such as South Africa (36th in absolute number of GitHub commits), Nigeria (45th), and Kenya (50th) rank closer to the top 10 than those among the Arab States such as Egypt (52nd), the United Arab Emirates, UAE (67th), and Morocco (75th).

A closer look at the commit numbers at the city level shows Moscow, Russian Federation (11th) in the CIS region with a performance that falls just outside of the top 10. Once again, urban areas in Africa like Lagos, Nigeria (95th), Cape Town, South Africa (102nd), and Nairobi, Kenya (106th) earn ranks above large urban spots in the Arab States such as Cairo, Egypt (203rd), and Dubai, UAE (219th).

From an income group perspective, China (3rd) and India (7th) are the only two economies in the top 10 GitHub commits

---

<sup>1</sup> Primary updates to the NRI 2021 apply across five sub-pillars: Access, Future Technologies, Individuals, Businesses, Economy, and SDG Contribution. A total of 60 indicators populate all 12 sub-pillars in the NRI. Details about any improvements within the complete list of indicators are found in Appendix I: Technical Notes and Appendix II: Sources and Definitions.

indicator rankings that are not among the high-income group. They are part of the upper-middle and lower-middle-income group economies, respectively. In addition to Moscow, the two non-top 10 ranked cities within upper-middle-income group economies are Hangzhou, China (22th) and Shenzhen, China (27th). Among the cities located within lower-income group economies, India dominates with four out of the five highest-ranked city rankings: Bengaluru (14th), Hyderabad (53rd), New Delhi (65th), and Mumbai (69th).

The top cities within low-income group economies are all located in Africa, with the top three consisting of Kampala, Uganda (299th), Addis Ababa, Ethiopia (893rd), and Kigali, Rwanda (1049th).

In addition to supporting the robust and informative value of this indicator, such results offer additional elements that corroborate the existence of technology gaps among economies at different levels of development. Yet, the data also provides an additional perspective that suggests the efforts for achieving higher levels of technology readiness remain inclusive at the global stage.

---

[i] Ojanperä, Graham, and Zook (2019) estimate that one-quarter of users can be geolocated—accounting for some 45 percent of all commits—but argue that this limitation does not entail any significant geographic biases.

[ii] Results are different when values are scaled by population. These results show values for dates between January 1, 2018, and December 31, 2018.

[iii] In the context of cities, it is important to note that the definition of an urban area is not always straightforward. The cities analyzed often refer to the urban center rather than the metropolitan area. The analysis complicates further by the discretion that users enjoy with respect to registering their city (the urban neighborhood versus the metropolitan area, the city of residence versus the city of employment).

## People

The prevalence and quality of technology reflect countries' (and any organization's) skill, access, and ability to utilize technology resources in productive ways. Therefore, the People pillar measures how people apply ICT at three levels of analysis: individuals, businesses, and governments.

- Individuals: how individuals use technology and leverage their skills to participate in the network economy.
- Businesses: How businesses use ICT and participate in the network economy.
- Governments: How governments use and invest in ICT for the benefit of the general population.

## Governance

Governance refers to the structures that uphold an integrated network for the safety and security of its users. Therefore, the Governance pillar concerns the establishment and accessibility of systems that promote activity within the network economy across three levels:

- Trust: The safety of individuals and firms in the context of the network economy, reflected in an environment conducive to trust and the trusting behavior of the population.
- Regulation: The extent to which a government promotes participation in the network economy through regulation, policy, and planning.
- Inclusion: The digital divides within countries where governance can address issues such as inequality based on gender, disabilities, and socioeconomic status.

## Impact

Readiness in the network economy is a means to improve the growth and well-being of society and the economy in general. Therefore, the Impact pillar seeks to assess the economic, social, and human impact of participation in the network economy across three levels:

- Economy: The economic impact of participating in the network economy.
- Quality of life: The social impact of participating in the network economy.
- SDG contribution: The impact of participating in the network economy within the context of SDGs. ICT has a critical role within the network economy and receives particular focus with indicators integrated across health, education, and the environment.

# Detailed Results of NRI 2021

# Detailed Results

## Overall rankings

The Network Readiness Index 2021 ranks a total of 130 economies. The Netherlands moved up three positions from last year and, for the first time, emerged as the most network-ready economy, followed by Sweden and Denmark that swapped spots (Table 1). The United States experienced the most positive movement among the top 10 economies, surging from the eighth rank to fourth. Finland rounded out the top five, moving up one position from sixth. For the remaining top 10 Switzerland moved down from 5th to 6th, Singapore dropped from 3rd to 7th, Germany shifted up one spot to

8th, Norway bumped two spots from 9th to 7th, and the United Kingdom held its position from the 2020 NRI at 10th.

The top 10 performers in the NRI 2021 confirm that advanced economies in Europe, the Americas, and Asia and the Pacific are the world's most network-ready societies. Out of the top 25 countries, 17 are from Europe (primarily Northern and Western Europe), three are from Eastern and Southeastern Asia (Singapore, the Republic of Korea, and Japan), two are from Oceania (Australia and New Zealand), two are in North America (Canada and the United States), and one in Western Asia (Israel).

**TABLE 1: NRI 2021 RANKINGS, SCORES, INCOME GROUP AND REGION**

Rank	Economy	Score	Income group	Region
1	Netherlands	82.06	High-income	Europe
2	Sweden	81.57	High-income	Europe
3	Denmark	81.24	High-income	Europe
4	United States	81.09	High-income	The Americas

## Pillar-level performances

Top performers in the overall rankings demonstrate positive scores across the four primary pillars of the NRI: Technology, People, Governance, and Impact. It is typical for the best-performing countries in the index to rank well in each of the different pillar dimensions. However, the count of top 10 economies with at least three top-ten pillar rankings dropped by one from eight to seven in 2021. A similar aspect occurs at the lower rankings, with six of the last 10 economies having at least three pillars among the bottom 10 rankings. As a recurrent finding, this demonstrates the relevance of multidimensional approaches to network readiness improvements. It also hints at a broad range of issues that can help economies strengthen strategy and design policies that lead to a faster pace of digital transformation.

Although similarities become evident among the high performers, analysis confirms that their operations do not differ much within the fundamental sub-pillars such as Future technologies, Trust, Regulation, and Quality of life. Differences may become more apparent regarding the particulars of each sub-pillar associated with the economy, individuals, or their governments, including aspects such as the research on and the adoption of emerging technologies.

Economies featured lower in the NRI rankings demonstrate different priorities, with Governance and Technology pillars more relevant to middle-ranked countries. Countries in this segment of the NRI could improve the balance of their pillar performances by increasing the current levels of trust, access, and skillset expansion towards network readiness.

**Technology:** The United States emerges as the highest-ranking economy in the Technology pillar, supported by the top score in the Future Technologies sub-pillar and two top-five rankings in Access (2nd) and Content

(4th). Switzerland and the Netherlands also display notable performances in Technology, ranking second and third respectively. Both economies exhibit particular strength in the Content sub-pillar, with Switzerland in the first-place position and the Netherlands in second. Australia earned the top spot in the Access sub-pillar, attributed to its balanced levels of mobile tariffs and the affordability of its handset prices.

**People:** The Republic of Korea leads the People pillar, supported by top five rankings across all three sub-pillars and positive performances concerning Businesses and Governments. Despite the Republic of Korea's positive scores, Japan earned the top spot in the Businesses sub-pillar, due to high levels of gross expenditure on R&D financed by business enterprises, technicians, and associate professionals. Denmark ranks second behind the Republic of Korea in the People pillar and showcases leadership in the Government sub-pillar with the greatest investment in R&D by governments and higher education. Turkey emerges as a leader in the Individuals sub-pillar, supported by high levels of tertiary enrollment. Finland and Sweden display strong performances in People as well, driven by positive scores concerning their prevalence of online services in business and government. The United States rounds out the top 5, leading when it comes to investment in telecommunication services.

**Governance:** Northern European countries dominate the Governance pillar, with Norway remaining the top-ranked economy supported by a top rank in the Regulation sub-pillar. The Netherlands earned second position, driven by a strong performance in the Trust pillar, even with Denmark taking first place. Denmark also claimed the top spot in the Secure Internet servers and Internet shopping indicators to best a second-place performance in the Online access to a financial account indicator. Finland and Sweden round out the top 5

## Detailed Results

with sophisticated displays of Governance, attributed to strong performances in the Adaptability of legal frameworks to the challenges presented by emerging technologies indicator. Singapore earned first rank in the Inclusion sub-pillar with marked improvements in Internet access gaps between genders and rural populations.

**Impact:** Singapore maintains its dominance in the Impact pillar, ranking first in both Economy and SDG Contribution sub-pillars. The strong performance results from the country's efficiency in high-tech and medium-high tech manufacturing,

a continued emphasis on high-quality education, and a focus on sustainability in its cities and communities. Sweden, an economy driven by sustainability, ranks second behind Singapore. The Netherlands ranks third, whose prevalent gig economy stands out with high scores. Ireland ranks fourth in Impact, in part attributed to its ICT services exports and the availability of affordable and clean energy within the country. Finland rounds out the top 5, emerging as the global leader in its quality of life ranking, where citizens enjoy a strong sense of happiness and freedom to make life choices.

## Top 10 NRI performers

While the top 10 countries from the NRI 2021 remained the same as the previous year, the exact rank of each economy changed (e.g. The Netherlands took the top spot from Sweden, while the United States entered the top five for the first time in the 2019 - 2021 period).

It is noteworthy that the top 10 performers are all high-income economies and do well across most pillar dimensions of NRI. Each of the top 10 countries achieves top 20 rankings across all four primary pillars (Technology, People, Governance, Impact) and does equally well on at least two-thirds of the 12 sub-pillars.

As for regional distribution, Singapore is the only top 10 country located in Asia or the Pacific, and the United States is the only society located in the Americas. The rest of the top 10 rankings consist of European countries.

A detailed look at the top ten performers can demonstrate the comparative strengths and weaknesses of each country's performance regarding network readiness.

**1. The Netherlands:** The Netherlands ranked as the most network-ready society in the NRI for the first time since 2019. Even though the Netherlands does not take the top rankings in many primary or sub-pillar levels, it dominates the rankings with a well-rounded performance. The highest ranking achieved at the primary pillar level involved a second-place in Governance, a third place in Technology (3rd), and a third place in Impact (3rd). The country benefits from positive performances at the sub-pillar level due to world-class digital content creation (2nd place in the Content), and remarkable levels of trust (3rd place in the Trust) and regulation (4th in the Regulation). The Netherlands also holds one of the top scores in the Impact pillar (3rd) with solid performances

in Economy (6th), Quality of Life (4th), and SDG Contribution (11th) sub-pillars, even if there is some room for improvement in regards to the Affordable and Clean Energy Indicator (45th rank). The Netherlands showed increases in the People primary pillar (7th) due to improvements in the Individuals sub-pillar. Enhanced measurements affected the use of ICTs among individuals, shifting the Individuals sub-pillar ranking from 20th in 2020 to 5th in 2021, resulting in a better overall performance.

**2. Sweden:** Sweden achieved a top three rank again in the NRI 2021, albeit dropping one position from last year. Similar to the well-rounded ranks posted by the Netherlands, Sweden maintains a positive overall performance in all areas of network readiness. Sweden's highest position relates to the Impact (2nd) pillar, reflecting the country's global leader status when it comes to adopting and investing in technologies that improve the social and human aspects of the network economy. Other high-performance areas by Sweden include Happiness (7th), Freedom to make life choices (7th), Good Health and Well-Being (6th), Females employed with advanced degrees (7th), and the Sustainable cities and communities (6th) indicators. Sweden ranks in the top 10 in every sub-pillar except Access (15th) and Individuals (28th). Its best scores relate to the adoption of Future Technologies (2nd), Businesses (3rd) and Trust (5th) sub-pillars. The country also benefits from balanced and progressive regulation policies of ICTs (5th place in the Regulation sub-pillar) and displays substantial e-commerce legislation that earns a first place position in the E-commerce Legislation indicator. Some areas of opportunity for Sweden involve the use of digital technologies among individuals, most likely due to the low affordability of devices and connectivity options (the country ranked 33rd for the Handset prices indicator). Enhancing levels of cybersecurity

## Detailed Results

can also improve future rankings (Sweden placed 33rd in the Cybersecurity indicator).

**3. Denmark:** Denmark maintains its top three ranking in the NRI 2021. Excellent scores in the Governments (1st) and Businesses (7th) sub-pillars reflect the extensive ICT use within the country and earn a second place ranking in the People pillar. Denmark also displays a high performance towards the Governance pillar (3rd), assisted by top rankings in Trust (1st) and Regulation (6th) sub-pillars showing a sophisticated regulatory framework of ICTs. On the other hand, Denmark can improve scores within the Impact (7th) pillar, where it placed 66th in the GDP per person engaged indicator, a weak performance in the context of high-income economies. Denmark also performs at lower levels than previously seen in the Technology (6th) pillar due to changes in ranking within the Access sub-pillar (21st). Although Denmark is the top-ranked society in the Population covered by at least a 3G mobile network indicator (1st), its overall access performance is affected by less than ideal scores in the Mobile tariffs (31st), Handset prices (46th), and SMS sent (42nd) indicators. The Inclusion sub-pillar can also afford an increase in rank, where a 43rd ranking in the Gender gap in Internet use indicator offset otherwise good indicator showings.

**4. The United States:** The US climbed to the fourth spot in the NRI 2021, marking its first appearance in the top five network economies since 2019. The shift in overall performance stems from an impressive response in the Future Technologies sub-pillar (1st). The Impact pillar (16) is the only pillar where the US does not rank among the top 10, but the country maintains a comprehensive performance in the Access (2nd), Content (4th), and Trust (4th) sub-pillars, among others. Consistent and robust

investments in emerging Technologies (the country ranks first in the Emerging Technologies indicator) explain the United States' key score advantage, further boosted by the general availability and affordability of devices (the US takes first place in the Handset prices indicator as well). The US also excels at generating digital content, likely contributing to its top overall performance in the Technology pillar. The US can improve its performance in the Governance pillar (7th) if it focuses on its low comparative score in the Regulation sub-pillar (19th). To better compete with its European counterparts, the United States would benefit from enhanced legal protection of privacy that can increase its low rank in the Privacy protection by law content indicator (76th). Similar to last year, the country's worst performance at the pillar level concerns Impact (16th), and better showings in Income inequality (81st), Affordable Clean Energy (83rd), and Quality of Life indicators (45th) would contribute to elevated scores.

**5. Finland:** Finland also climbed to the top five in the NRI 2021. Overall, the country performed well, earning top five positions in all pillars except for a ninth-place rank in Technology. Finland's best pillar-level performance occurred in the People pillar (3rd), set up by strong adoption of digital services by businesses, a high number of firms with websites, and the effective use of ICTs by governments. Performances translated into an eighth position ranking in the Businesses sub-pillar, a third in the Governments sub-pillar, and a first in the Firms with a website indicator. Still, Finland achieves its best sub-pillar performance in Regulation (2nd), supported by balanced scores in the E-commerce legislation and Emerging Technologies indicators (both ranked 1st). Finland's weaker rankings relate to the Technology pillar (10th) due to overlooked access to ICTs and SMS sent by the population (13th position for the

## Detailed Results

Access Sub-pillar and 77th for the SMS sent indicator). As for the Impact (5th) pillar, a weaker performance in the SDG contribution sub-pillar (13th) dampens the impressive showings in the Quality of Life indicator (1st). Finland can enhance the role of digital technologies in promoting sustainable development for a better overall score, as the Impact pillar is currently lowered by an uncharacteristically weak showing in the Affordable and Clean Energy indicator (104th).

**6. Switzerland:** Switzerland falls outside of the top five with an overall ranking that is a fraction lower than Finland. The country's best performance on the pillar level relates to Technology (2nd), where it earns a first in Content indicator (1st) and a fourth in the Investment in emerging technologies (4th). Switzerland also performs well with regards to the effect of digital technologies on its society, leading to a sixth place ranking in the Impact pillar. Impact rankings are supported by advanced scores in Economy (7th), Quality of Life (8th), and SDG Contribution (8th) indicators. When it comes to the People (12th) and Governance (11th) pillars, Switzerland shows some room for improvement compared to other high-income peers (which could explain its drop in rankings). The country performs well concerning the adoption of ICTs by businesses (5th in the Businesses indicator), but scores are slightly offset by less impressive results in the Government sub-pillar (17th). As for the Governance primary pillar (11th rank), Switzerland benefits from an improved regulatory framework for ICTs (3rd in Regulation sub-pillar) in addition to good rankings in the E-commerce legislation (1st) and the Privacy protection (5th) indicators. The strong showings in the Governance pillar are offset by a weak score in the Inclusion sub-pillar (15th), reflecting a less than ideal Gender gap in Internet use (64th) and a Rural gap in use of digital payments (27th) indicator ranks.

**7. Singapore:** Singapore's ranking in the NRI 2021 dropped by five positions, and the city-state finds itself out of the top three network-ready economies for the first time since 2019. But Singapore still shows an overall strong performance in all pillars, with Governance (12th) as the only area where it ranks outside the top 10. Singapore is second to none when it comes to the Impact (1st) pillar and the positive effect of digital technologies on its society, reflected by first place scores in the Economy and SDG contributions sub-pillars (Singapore maintains its impressive investment in sustainable development). Singapore's other strength relates to the Technology pillar (8th) due to accessible ICTs (3rd in the Access sub-pillar) and robust financing of future tech (4th place in the Future Technologies sub-pillar). However, there is a possibility for further improvements in digital content creation (Singapore ranked 23rd in the Publication and use of open data indicator). Singapore did score well in the People pillar (9th) because of an impressive fourth place rank in the Governments sub-pillar, but performances in the Individuals (11th) and Businesses (16th) sub-pillars are lower than years previous and appear to have impacted overall performance. Singapore can improve its rank most within the Governance primary pillar (12th) where low levels of trust towards the digital economy (19th in the Trust sub-pillar) offset impressive showings in the Inclusion (1st) sub-pillar and the Rural gap in the use of digital payments indicator (2nd). Singapore has the opportunity to change its score in the Regulation sub-pillar (10th) with a better showing in the Privacy protection by law content indicator (95th), an area currently led by its regional peers.

**8. Germany** remains in the top 10 with a strong overall performance across all primary pillars. The country scores best in the Technology pillar (5th), while its weakest showing is in Governance (13th), the only

## Detailed Results

pillar where Germany earns a primary pillar rank outside of the top 10. Positive scores in the Technology pillar stem from notable investments in future tech (Germany ranked 3rd in the Future Technologies sub-pillar) and the widespread production of digital content (6th in the Content sub-pillar). Germany could improve its overall score in the Technology pillar with better performances in the Access sub-pillar (24th), where relatively less affordable ICTs (26th in the Handset prices indicator) and their use (SMS sent) dampen results. Germany displays some strength in the People pillar (8th) with mixed rankings in its three sub-pillars: Business (4th), Governments (14th), and Individuals (23rd). Each sub-pillar reflects the high usage of ICTs among businesses amongst the limited usage by Governments and Individuals. As for the Governance pillar (13th), more focus on the Inclusion sub-pillar can increase rankings, as the country has the opportunity to improve upon the Gender gap in Internet use (69th indicator ranking) and low overall levels of E-participation (56th indicator ranking).

**9. Norway:** Norway maintains its global leadership in the Governance pillar (1st) due to its progressive ICT regulation and a high level of public trust (scoring first in the Regulation sub-pillar and second in the Trust sub-pillars). Norway also shows well within the People pillar (6th), driven by widespread usage of ICTs amongst individuals (9th) and one of the world's most digitally engaged governments (scoring ninth in Individuals sub-pillar and third in Governments sub-pillars). However, the country can increase the adoption of technology by businesses (18th in the Business sub-pillar) with particular reference to the Active mobile broadband subscriptions indicator (76th), as it currently holds down the overall score in the People pillar. Norway ranks 11th in the Impact Pillar, attributed to high scores in the Quality of Life and Contribution to the SDGs indicators

(both ranked 3rd). A weak performance in the Economy sub-pillar (33rd) counterbalances scores in the Impact pillar where significant opportunities for improvement regarding the ICT services exports indicator (62nd) and labor productivity as measured by the growth rate of GDP (69th in the GDP per person engaged indicator) exist. Norway's Technology (13th) pillar shows development potential in the Future Technologies sub-pillar (37th), especially with the low rank in the Robot density indicator (26th). However, the country maintains a solid performance toward ICT access (7th in the Access Sub-pillar) and digital content creation (3rd in the Content Sub-pillar), both of which guarantee Norway's top 10 position.

**10. The United Kingdom** maintains in 2021 its position as the 10th most-network ready economy. The UK shows best in the Technology pillar (6th) due to high scores in the Access (4th) and Content (5th) sub-pillars, though rankings dampen from a weak showing in the Future Technologies sub-pillar (16th). The UK also performs well regarding the impact of ICTs on its society (9th in the Impact pillar), boosted by aggressive sustainable development goals investments (2nd place in the SDG contribution indicator). Conversely, the United Kingdom's output reduces within the People (16th) and Governance (14th) pillars. The People pillar benefits from having a digitally engaged government (10th in the Governments sub-pillar), but raising ICT usage and skills among individuals and Businesses (34th in the Individuals sub-pillar and 24th in the Businesses sub-pillar) will present a challenge. As for the Governance pillar (14th), the economy's engagement in both the Trust (13th) and Inclusion (8th) sub-pillars remain relatively stable. Less effective operations in the Regulation sub-pillar (21st) hurt Governance pillar scores, where regulatory protection for privacy is an area to focus on (the UK ranked 90th in the Privacy protection by law content indicator).

## NRI Performances by Income Group<sup>1</sup>

A clear correlation exists between an economy's NRI performance and its income level. Figure 1 confirms the relationship of each factor by plotting NRI scores against GDP per capita in terms of purchasing power parity (PPP). The top NRI performers are predominantly high-income economies,

<sup>1</sup> Countries are grouped according to the World Bank Income Classifications. Economies are divided based on their 2019 gross national income (GNI) per capita, calculated using the World Bank Atlas method

while the bottom NRI performers are mainly low-income economies. Lower middle-income and upper middle-income economies occupy a range between both extremes of the trend line. Of interest, certain economies perform above the expectations associated with their income level, and plot above the trendline. Economies that operate at lower-than-expected levels in regards to income level appear below the trend line. Performances above or below the trend line are not exclusive to income level groups, suggesting the existence of network readiness divides among same

FIGURE 1: NRI SCORE VERSUS GDP PER CAPITA (PPP)

Note: GDP per capita is in PPP\$ (natural logarithms). Both GDP per capita and population data (represented by the size of the bubbles) are for 2019 or the latest year available. The data are drawn from the World Bank's World Development Indicators database. The general trend line is a polynomial of degree two ( $R^2 = 0.85$ ). Countries are grouped according to the World Bank Income Classifications (July 2021). Source: Network Readiness Index Database, Portulans Institute, 2021.

# Detailed Results

Summary statistics of each income group also reinforce the positive correlation between NRI score and income level. Figure 2 shows how NRI scores differ across the four income groups. The dispersion of NRI scores among high-income economies is greater than in the other income groups, as reflected by the size of the box-and-whisker plots.

Figure 2 and Figure 3 depict the existing gap in NRI scores between high-income

economies and the other income groups, with clear gaps between the upper middle-income, lower middle-income, and low-income groups as well. The data suggest that the 25th percentile of one income group performs at a slightly higher level than the 75th percentile of the income group just below it. Upper middle-income economies at the 25th percentile scored 46.07 in 2021, matching the 45.18 score of lower middle-income economies at the 75th percentile.

FIGURE 2: NRI SCORES BY INCOME GROUP

Note: The whiskers indicate minimum and maximum values, while the extremes of a box indicate the 25th and 75th percentiles. The line within a box represents the median (i.e. 50th percentile) Source: Network Readiness Index Database, Portulans Institute, 2021.

# Detailed Results

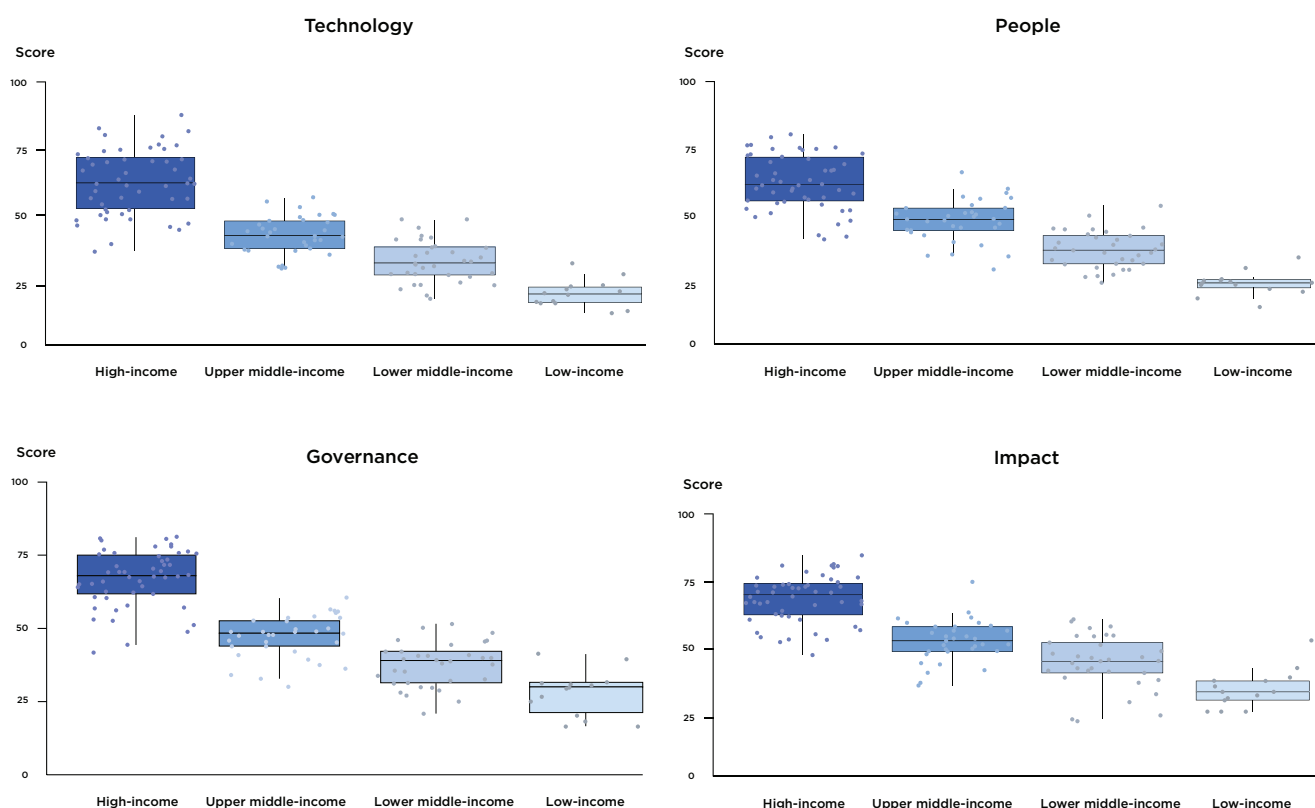

Differences in NRI performance across income groups are also observed within each primary pillar of the NRI (Figure 5). Each pillar demonstrates similar trends of higher-income economies outperforming lower-income economies. Sub-pillar performances also follow the same pattern.

However, some differences in performance across pillars emerge when viewed through the lens of income groups. First, high-income economies score comparatively higher in Technology and Governance, as the gaps in relation to other income groups are often greater in these two pillars. Second, the group of upper middle-income economies exhibits increased performance rankings within the People pillar, as the scores of the median upper middle-income economy are closer to the

scores of the median high-income economy. Third, all income groups demonstrate the least amount of performance variation within the Impact pillar. The gaps between the various income groups in the Impact pillar are less pronounced than in other pillars. The Impact pillar also has the lowest standard deviation, especially for low-income economies.

High-income economies display the greatest variation in scores among all four pillars. Levels of variation continue to decline across all groups in line with income decreases. Differences in variation between income groups are most apparent within the Technology and People pillars, where high-income economies have the greatest variation, and low income economies have the least.

**FIGURE 3: SCORES BY INCOME GROUP AND PILLAR**

Note: The whiskers indicate minimum and maximum values, while the extremes of a box indicate the 25th and 75th percentiles. The line within a box represents the median (i.e. 50th percentile) Source: Network Readiness Index Database, Portulans Institute, 2021.

## Detailed Results

Table 3 lists the top three economies of each income group. The Netherlands (1st), Sweden (2nd), and Denmark (3rd) are the top-performers among high-income economies (for more information, please refer to The Top NRI performers section), and Rwanda

(101st), Tajikistan (111th), and Gambia (113th) earn top performance scores for low-income economies. Comparative performances in each pillar vary among the three economies and offer insight into the relationship between Network Readiness and Income.

**TABLE 3: TOP 3 COUNTRIES BY INCOME GROUP**

High-income	Upper middle-income	Lower middle-income	Low-income
1. Netherlands (1)	1. China (29)	1. Ukraine (53)	1. Rwanda (101)
2. Sweden (2)	2. Malaysia (38)	2. Viet Nam (63)	2. Tajikistan (111)
3. Denmark (3)	3. Russian Federation (43)	3. India (67)	3. Gambia (113)

Note: Global ranks in parentheses (Detailed results can be found in next section).

Source: Network Readiness Index Database, Portulans Institute, 2021.

## Detailed Results

The top three **upper middle-income economies** are China (29th), Malaysia (38th), and Russia (43rd). China is the only non-high-income economy to earn a ranking in the top quartile of the NRI 2021, in part attributed to its positive performance in the People pillar (20th). At the sub-pillar level, China also scores well in Businesses (6th) and Individuals (19th) indicated by strength in annual investment in telecommunication services and active mobile broadband subscriptions. China's highest ranking is in the Impact pillar (13th), due to an export-oriented high-tech industry and an emphasis on Sustainable Development Goal 4: Quality Education. In contrast, China's weakest pillar is Governance (45th), which is impacted adversely by the state of Regulation (87th) of the ICT landscape and Inclusion (48th) of more rural populations in digital participation.

**Malaysia's** performance also displays a sophisticated degree of network readiness. Compared to its income group peers, Malaysia's economy stands as one of the strongest with high-tech exports, a prevalent gig economy, and efficient high-tech and medium-high tech manufacturing. Malaysia ranks just one position below China in Technology (37th), where it exhibits positive performance scores in international Internet bandwidth that in turn benefits the Access (37th) sub-pillar. Like China, Malaysia's weakest pillar is also Governance (40th) with lower scores in Regulation (46th) and Inclusion (43rd). Although Regulation is Malaysia's lowest ranking sub-pillar, it is among the higher Governance rankings in the group of upper middle-income economies. Malaysia displays a balanced profile when it comes to distribution of performance across the four pillars. Its rankings across the four primary pillars differ by only one position, ranking 37th in the Technology pillar, 38th in the Impact pillar, 39th in the People pillar, and 40th in the Governance pillar.

**The Russian Federation's** highest ranking pillar is People (35th), where

scores in the Businesses sub-pillar (36th) and the Governments (34th) sub-pillar reflect an advanced level of investment in telecommunication services and the publication and use of open data. Conversely, the Russian Federation has the largest scope of improvement within the Governance (54th) pillar, with low scores in the Regulation sub-pillar (118th) due to lower scores on e-commerce legislation and the privacy protection by law of content.

The group of **lower middle-income economies** is led by Ukraine (53rd), Viet Nam (63rd), and India (67th). Ukraine scores well in the Impact pillar (47th), an improvement over last year when the pillar was its lowest score. Ukraine's Impact ranking is followed closely by People (48th), where a high score in the Individuals sub-pillar (17th) is offset by lower scoring in the Government sub-pillar (71st), partly due to lower R&D expenditure by governments and higher education. Ukraine also scores well within the Technology pillar (50th) due to its spending on software development and creation of content. Its weakest ranking relates to the Governance pillar (57th). Addressing regulatory quality and digital access gaps for the general population and rural areas could improve Ukraine's rankings in the Regulation (61st) and Inclusion (65th) sub-pillars.

**Viet Nam** also scores higher than the income group average in each of the four pillars. However its scoring in Impact (44th) stands out as a distinct strength for the economy. The high score is attributed in part to robust labor productivity, an export-oriented high-tech industry, and the prevalence of a gig economy, which boosts the ranking in the Economy sub-pillar (25th). Viet Nam also enjoys a considerable freedom to make life choices, leading to a 53rd ranking in the Quality of Life sub-pillar. Some gains are lost with the economy's performance in the SDG Contribution sub-pillar (80th), however this ranking could increase with improved sustainability and a continued quality of education. Viet Nam performs well

## Detailed Results

in Technology (61st) compared to its income group peers, reflected by the country's access to technologies (50th ranking in the Access sub-pillar) and production of content (55th ranking for the Content sub-pillar). For Governance (73rd), Viet Nam ranks well in with the Trust sub-pillar (50th), but overall scores are offset by weaker levels in the Regulation (93rd) and Inclusion (97th) sub-pillars. Viet Nam shows opportunities for improvement in the People pillar (80th), determined by the performance scores in the Business (105th) and Governments (87th) sub-pillars. Expenditure on R&D and an increased share of professionals in the workforce can boost future scores.

The top performers in the **low-income group** include Rwanda (101st), Tajikistan (111th), and Gambia (113th). Each economy shows moderate to high levels of variation across the four pillars. As the highest ranking low-income group economy, Rwanda shows strength in the Governance pillar (86th), due to its balanced performance across the three sub-pillars: Trust (89th), Regulation (89th), and Inclusion (86th). However, at the sub-pillar level, Rwanda's best performance relates to Governments (57th), scoring well with indicators related to the promotion of investment in emerging technologies and R&D expenditure. Areas of opportunity are apparent in the People pillar (103rd), with challenges regarding use of virtual social networks and tertiary enrollment levels, particularly for technicians and associates. Rwanda's ranking in the Technology pillar (107th) is dampened by low levels of Access (111th) and production of Content (116th) at the sub-pillar level.

**Tajikistan** exhibits a strong performance in the Impact pillar (73rd), where it earns a ranking in the third quartile. This ranking can be attributed to the country's performance in the SDG Contribution (38th) and Quality of Life (70th) sub-pillars, as well as a comparative strength in low levels of income inequality. Tajikistan does find itself ranking lower across the remaining pillars of Technology (118th), Governance (119th), and People (120th). Performances in the mid-ranking pillars indicate room for improvement in Access (129th) and Regulation (127th) sub-pillars, with particular focus on regulatory quality and privacy protection. In the country's lowest ranking pillar, People (120th), the areas with the greatest margin for improvement are indicators related to usage of ICT by the government (121st) and businesses (127th).

**Gambia** ranks highest in the Technology pillar (96th), where its performance in the Future Technologies sub-pillar (53rd) reflects an increase in the adoption of and investment in emerging technologies in the country. Gambia ranks 109th in both Governance and Impact, however the former ranking displays a wider distribution of performances. The country's promising regulatory environment and e-commerce legislation, is dampened by lower levels of Inclusion (130th). Gambia displays the most scope for improvement within the People pillar (125th) and can elevate future scores by promoting investment in emerging technologies, boosting tertiary enrollment, and improving adult literacy rates.

## NRI Performances by Region

Figure 4 displays an overview of NRI statistics across six regions: Africa, the Arab States, Asia and the Pacific, the Commonwealth of Independent States (CIS), Europe, and the Americas. Within each region, there is a clear correlation between regional performances and the frequency of income groups. Over

three-quarters of the countries in Europe (76 percent) are high-income economies, and Europe maintains its strong leadership position in the NRI 2021. In contrast, the region of Africa earns the lowest scores and has the highest concentration of lower-middle-income or low-income economies.

FIGURE 4: SCORES BY INCOME GROUP AND PILLAR

NRI Score

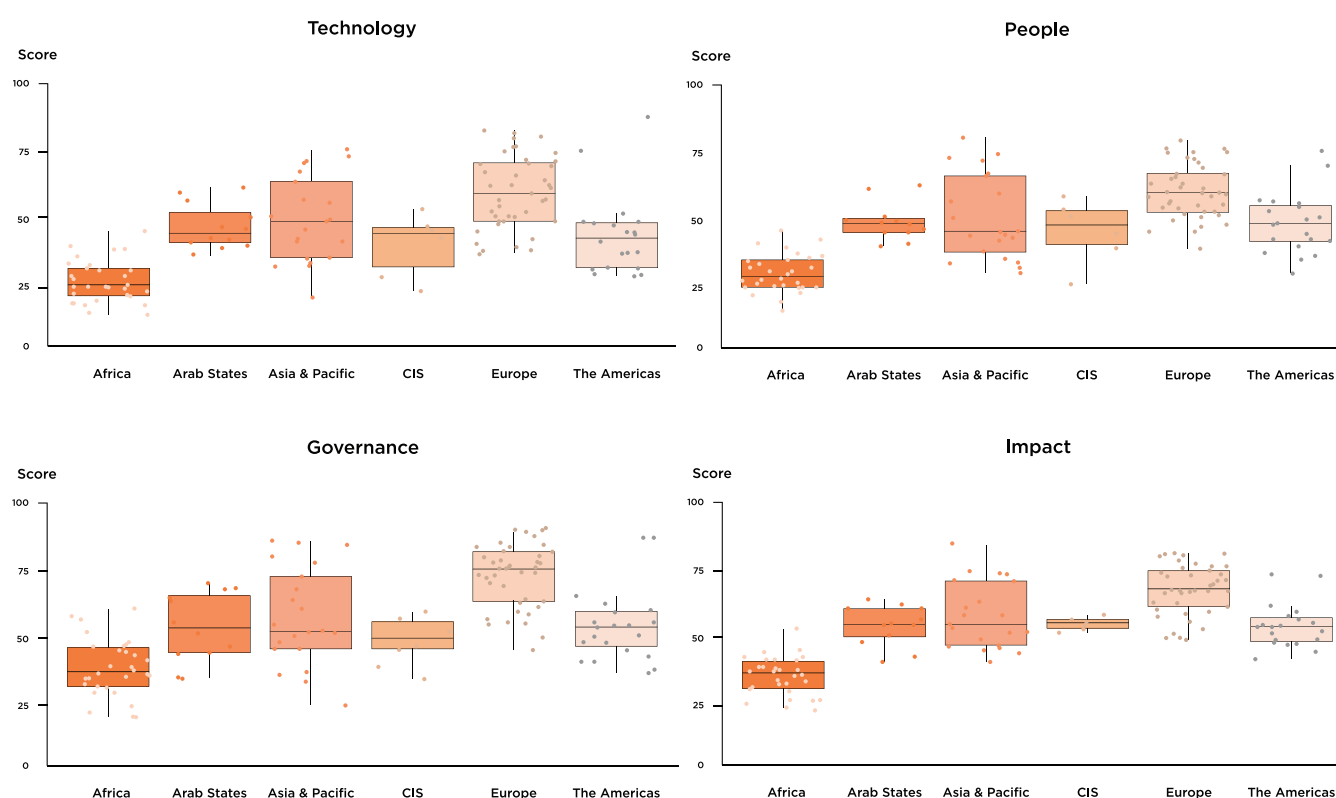

Note: The whiskers indicate minimum and maximum values, while the extremes of a box indicate the 25th and 75th percentiles. The line within a box represents the median (i.e. 50th percentile) Source: Network Readiness Index Database, Portulans Institute, 2021.

# Detailed Results

Regions with an increased number of countries also demonstrate a wider dispersion of NRI scores. For example, the score variation in Europe (a total of 41 countries) is much higher than in the Commonwealth of Independent States (a total of 6 countries). However, Asia and the Pacific present a different pattern, showing less variation in scores than Europe despite a sizable amount of economies (21) spread across a larger region. Thus, the coefficient of variation can consider the different means across geographical areas

and functions as a more appropriate measure of dispersion. With an analysis based on a relative standard of deviation, economies in Asia and the Pacific experience the highest relative dispersion compared to Europe and the CIS. Furthermore, it suggests that the dispersion of Arab States is nearly as high as that of Africa (30 countries) and higher than that of the Americas (20 countries), despite the region's significantly smaller number of economies (12).

**FIGURE 5: NRI SCORES BY REGION AND PILLAR**

Note: The whiskers indicate minimum and maximum values, while the extremes of a box indicate the 25th and 75th percentiles. The line within a box represents the median (i.e. 50th percentile) Source: Network Readiness Index Database, Portulans Institute, 2021.

# Detailed Results

Europe maintains its leadership position as the most network-ready region with an impressive overall performance across all four NRI pillars, while Africa is the most laggard regional group. The group of Arab States does comparatively better than other regions concerning the People pillar,

especially compared to Asia and the Pacific (which struggles with low scores in the People Pillar despite strength in the Technology pillar). The Americas perform best within the Governance pillar, the weakest area for the CIS region.

## Notable scores by individual countries

TABLE 4: NRI 2021 TOP 3 ECONOMIES BY REGION

Africa	Arab States	Asia & Pacific	CIS	Europe	The Americas
1. South Africa (70)	1. United Arab Emirates (34)	1. Singapore (7)	1. Russian Federation (43)	1. Netherlands (1)	1. United States (4)
2. Mauritius (71)	2. Saudi Arabia (40)	2. Korea, Rep. (12)	2. Ukraine (53)	2. Sweden (2)	2. Canada (11)
3. Egypt (77)	3. Qatar (42)	3. Australia (13)	3. Armenia (60)	3. Denmark (3)	3. Chile (44)

Source: Network Readiness Index Database, Portulans Institute, 2021.

### Africa

The highest-ranked economies in Africa are South Africa (70th), Mauritius (71st), and Kenya (84th).

**South Africa:** earns its highest rank in the Governance pillar (51st), reflecting solid showings across all three sub-pillars (60th in Trust, 51st in Regulation, and 51st in Inclusion). The country also performs well in the Technology (63rd) pillar due to a strong performance in the Future Technologies (45th) sub-pillar. Robust investment and adoption in emerging technologies at the indicator level (33rd in the Adoption of emerging technologies indicator, 40th in the Investment of emerging technologies indicator, and 24th rank in Computer

software spend indicator) support the Future Technologies sub-pillar. South Africa's weakest performance relates to the Impact (103rd) pillar, where low scores in the Quality of Life (123rd) and SDG Contribution (86th) sub-pillars dampen positive showings in the Economy sub-pillar (67th). Indicators that would benefit from increased focus are Healthy life expectancy at birth (112th) and SDG 7: Affordable and Clean Energy (115th).

**Mauritius:** is the second-best performing African country with an overall score attributed to relative positive showings in the Governance Pillar (58th) compared to regional peers. High ranks in the Trust (62nd) and Inclusion (61st) sub-pillars help push the Governance pillar score above expectations. In particular, Mauritius ranks within the top 50 economies

## Detailed Results

regarding the Rural gap in the use of digital payments indicator (49th), a score that contributed to a positive Inclusion sub-pillar rank. The Regulation (67th) sub-pillar does offer the possibility for improvement, where a somewhat fragmented legal framework and a low E-commerce Legislation indicator ranking (76th) offset good scores in the Regulatory quality indicator (35th). The country's weakest area relates to the People pillar (87th), where a surprisingly low adoption of digital technologies by Businesses (123rd in the Business sub-pillar) and to a lesser extent by Governments (74th in the Governments sub-pillar) overshadows the widespread use of ICTs among Individuals (59th in the Individuals sub-pillar).

**Kenya:** similar to South Africa, performs best in the Governance pillar (59th). Good scores in the Trust (52nd) and Regulation (63rd) sub-pillars explain the noteworthy Governance performance. A strong performance in the Online access to financial accounts indicator (18th) props up the Trust sub-pillar, while Kenya's proper ICT regulatory environment and e-commerce regulation speak to its strong score in Regulation. Kenya still faces a challenge concerning the Inclusion sub-pillar (79th), where a noticeable gender gap in internet use is apparent (88th rank in the Gender gap in Internet use indicator). The country's weakest performance is in the Impact pillar (106th), despite a positive comparative rank in the Economy sub-pillar (59th) and top 20 rankings in the GDP per person engaged (16th), ICT services exports (13th), Quality of Life (112th), and SDG Contribution (118th) indicators. Kenya can do more to improve its rank in the Females employed with advanced degrees (110th) and SDG 7: Affordable and Clean Energy (112th) indicators.

### Arab States

The United Arab Emirates (34th), Saudi Arabia (40th), and Qatar (42nd) are the

highest ranked Arab States in the NRI 2021.

**The United Arab Emirates:** has a solid overall performance across all pillars, but shows scores of particular strength in the People pillar (25th). The Arab Emirates benefits from one of the most digitally engaged governments (25th in the Governments sub-pillar), the widespread usage of ICTs by individuals (32nd in the Individuals Sub-pillar), and a high level of GERD by business enterprises (32nd rank in the Business sub-pillar). A first-place ranking in the Use of virtual social networks indicator further props up People pillar scores. The UAE also performs well in the Technology pillar (28th) with impressive levels of ICT access (27th in the Access sub-pillar) and investment in emerging technologies (15th in the Future Technologies sub-pillar). But even with a large population covered by at least a 3G network and high levels of Internet access, insufficient digital content creation (50th in the Content sub-pillar) offsets the country's excellent performance in the Technology pillar. Moreover, an underdeveloped regulatory framework for ICTs (80th in the Regulation sub-pillar) deters overall strong performances in Trust (30th) and Inclusion (28th) sub-pillars, leading to lower scores in the Governance primary pillar. Balanced e-commerce regulation and better safeguarding of privacy (125th in Privacy protection by law content) could assist overall performance rankings. UAE's weakest pillar-level operation relates to Impact (41st) where poor results in the SDG Contribution (62nd) and Economy (56th) indicators lower the impressive showings in Quality of Life (20th), Freedom to make life choices (10th), and Income inequality (5th).

**Saudi Arabia:** improved by one position in the NRI 2021 (40th overall) because of increased performance results in the Technology pillar (30th). The country

## Detailed Results

benefits from high levels of ICT access (17th in the Access sub-pillar) and significant rates of investment in new technologies (22nd in the Future Technologies sub-pillar). Content creation remains the area with the most room for development (56th in the Content sub-pillar) despite notable positive changes compared to last year. The People pillar (27th) remains Saudi Arabia's best pillar-level performance, resulting from better ICT usage and skills among individuals (24th in the Individuals sub-pillar), governments (32nd in the Governments sub-pillar), and businesses (34th in the Businesses sub-pillar). The country's weakest performance relates to the Impact (66th) pillar, reflecting the minimal effect of ICTs on the society. The SDG Contribution indicator (106th) ranked outside of the top 100, and the poor performance somewhat balanced strong showings in the Economy (49th) and Quality of Life (41st) indicators. Prioritizing education (69th in Quality Education indicator) and the sustainability of living centers (127th in Sustainable cities and communities indicator) could have a positive impact on the country's overall rank.

**Qatar:** showed its best performance in the Technology (35th) and Governance (36th) pillars, leading to a strong overall performance. Generous investments towards new technologies (21st in the Future Technologies sub-pillar) and ICT access (32nd in the Access sub-pillar) helped boost Qatar's rank in the Technology pillar. The country performs particularly well concerning the affordability of mobile tariffs (18th in the Mobile Tariffs indicator), and it achieves top ranks regarding handset prices, the population amount covered by at least a 3G mobile network, and the available Internet access in schools. Qatar could do more to increase the creation of digital content (62nd in the Content sub-pillar). Within the Governance Pillar, the country benefits from high levels of trust in digital technologies

(27th in the Trust sub-pillar), but there is room for improvement regarding government regulation, particularly with respect to the ICT regulatory environment (101st in the Regulation Sub-pillar). Qatar does rank at the top in e-commerce legislation compared to global competitors, helping increase Governance pillar scores. Qatar is weakest in the People (69th) and Impact (57th) pillars due to low sub-pillar scores: 103rd in the Businesses, 56th in Individuals, and 47th in Government. Prioritizing methods that fix the uncharacteristically low levels of ICT adoption by businesses (and to a lesser extent by individuals and governments) could result in better scores for the People pillar and the country's overall degree of network readiness.

### Asia and the Pacific

Singapore (7th), the Republic of Korea (South Korea, 12th), and Australia (13th) are the leading economies for network readiness in Asia and the Pacific.

**Singapore:** Find a detailed review of Singapore's NRI 2021 performance in the Top 10 NRI performers section on page <Insert page>.

**The Republic of Korea:** stands as the global leader of the People pillar (1st), with top 20 performances in the other three primary pillars. The country's unmatched performance within People reflects the widespread use of ICTs among individuals (4th in the Individuals sub-pillar) and an even more impressive amount of digital technology use by businesses and governments (2nd in both the Businesses and Governments sub-pillar). The Republic of Korea also scores well in the Impact pillar (18th), with strong showings in the Economy sub-pillar (5th) reflecting the country's scores in high-

## Detailed Results

tech and medium-high-tech manufacturing indicator (5th), high-tech exports indicator (6th), and PCT patent applications (2nd) indicators. Modest execution in the Quality of Life (49th) and SDG Contribution (27th) sub-pillars balanced the overall positive results within the Impact Pillar. Better access to affordable and clean energy in addition to enhanced freedom to make life choices can improve the country's Impact pillar scores. The Republic of Korea also stands out concerning Governance (17th), reflecting strong levels of trust towards emerging technologies (10th place in the Trust sub-pillar) and positive showings in the Inclusion sub-pillar (18th). The Regulation sub-pillar (36th) shows opportunity for improvement, particularly regarding the Republic of Korea's ICT regulatory environment (earning a 101st indicator score). In the Technology pillar (20th), The Republic of Korea displays strength in its access to ICTs (14th ranking in the Access sub-pillar) and its absorption and investment in emerging technologies (11th ranking in the Future Technologies indicator). A low score in the Content sub-pillar (34th) shows that an increased focus on computer software spending, the creation of content, and Wikipedia edits will lead to better scoring results for the Republic of Korea.

**Australia:** is the top economy with regards to ICT access because of affordable mobile tariffs (17th in the Mobile Tariffs indicator), competitive prices for handsets (1st in the Handset prices indicator), and improved internet access for schools (1st in the Internet access in schools indicator). As a result, Australia earns the top ranking in the Access sub-pillar. The country also ranks near the top 10 in content creation (11th in the Content sub-pillar) and has a modest output in investment and adoption of future technologies (30th in the Future Technologies sub-pillar). In sum, such positive sub-pillar results offer a noteworthy overall performance within the top 15 economies of the Technology pillar.

Australia also presents a strong overall performance in the People pillar, where it ranks among the top 10 in the Individuals sub-pillar (7th) and maintains top 20 scores in the Governments (12th) and Businesses (20th) sub-pillars. Australia achieves its 10th place Governance pillar score (10th) due to high levels of trust (8th in the Trust sub-pillar), inclusion (11th in the Inclusion sub-pillar), and progressive regulation (14th in the Regulation sub-pillar). Regulation displays some diverse showings, with Regulatory quality (4th) and E-commerce legislation (1st) indicators earning top rated scores while the Privacy protection by law content indicator (70th) has a more pressing outcome. When assessing the impact of digital technologies on Australian society (23rd in the Impact pillar), the use of ICTs could benefit from more focus. More specifically, better scores in the Economy (38th), GDP per worker (85th), Affordable and Clean Energy (79th), and ICT services exports (77th) indicators could improve the country's ranking in the Impact pillar.

**China:** ranks as one of the strongest performers in the region, standing amongst the top 20 in the Impact (13th) and People (20th) primary pillars. The country shows good performances in the Economy sub-pillar (3rd) because of continued exports of high-tech products (4th in the High-tech Exports indicator) and the growth rate of workers (5th in the GDP per person engaged indicator), helping boost Impact pillar scores. Weaker showings in Quality of Life (54th) and the overall Happiness (63rd) indicators offset progress, and China faces a challenge with income inequality (67th in the Income inequality indicator). A 17th ranking in the SDG Contribution sub-pillar and the global lead in the Quality Education indicator (1st) help complete the positive performances within the Impact pillar. China's execution in the Technology pillar (33rd) is also well-rounded, showing balanced access to ICTs (31st in the Access sub-pillar), robust

## Detailed Results

creation of digital content (43rd in the Content indicator), and extended investment in emerging technologies (32nd in the Future Technologies sub-pillar). China ranks at the top in international internet bandwidth, the number of AI scientific publications, and is among the top 15 in Robot density (14th), creating an environment for positive scoring in the Technology pillar. China shows relatively poor output in the Governance pillar (45th), where a weak regulatory framework (87th in Regulation) hampers high levels of trust towards digital technologies (36th in the Trust sub-pillar). In this context, Regulatory quality (90th), ICT regulatory environment (123rd), as well as Privacy protection by law content (111th) indicators show the most opportunity for improvement. Still, China manages to have highly sophisticated e-commerce regulation (1st in the E-commerce Legislation indicator) and a degree of e-participation that is among the highest globally (10th in the E-participation indicator).

**India:** (67th overall) is another strong economy in the region, and it made one of the most notable improvements in the NRI 2021 by jumping up 21 positions. The aggressive upward movement resulted from a better country-wide performance in addition to the introduction of more relevant indicators to the NRI framework. India displayed significant progress across most pillars and sub-pillars, with the Technology pillar (49th) as its best dimension. India benefits from high levels of access (40th in the Access sub-pillar) and solid levels of future technology investment (56th in the Future Technologies sub-pillar). Both sub-pillar scores benefit from India's leading performance in the International Internet bandwidth indicator (1st) and the newly introduced SMS sent by population 15-69 indicator (3rd). As for the Impact pillar (63rd), India ranks in the top quartile in the Economy sub-pillar (24th) with robust outputs in exported ICT services (4th in the ICT services exports indicator). However,

lower scores in the Quality of Life (92nd) and SDG Contribution (95th) sub-pillars slightly offset positive outcomes. Within the People pillar (73rd), India reflects a digitally engaged government but a relatively less effective ICT usage among Businesses and Individuals (46th, 76th, and 93rd in the Government, Businesses, and Individuals sub-pillars, respectively). The Governance pillar (82nd) offers India the most opportunity for action. High levels of cybersecurity are evident (15th in the Cybersecurity indicator), but insufficient scores in Online access to a financial account (113th) and Internet shopping (100th) indicators stifle scores in the Trust sub-pillar. The Inclusion sub-pillar (99th) also masks diverse aspects of India's network readiness, where a weak score in Gender gap in internet use (91st) reduces the substantial ranking of E-participation (29th).

### The Commonwealth of Independent States (CIS)

The Russian Federation (43rd), Armenia (60th), and Kazakhstan (61st) lead the region of the Commonwealth of Independent States (CIS).

**The Russian Federation:** improved its performance across the Technology (39th), Governance (54th), and Impact (51st) primary pillars, but the country scored best within the People pillar (35th). The people pillar remained propped up by extended ICT usage and ICT skill among businesses (36th in the Businesses sub-pillar), governments (34th in the Government sub-pillar), and to a lesser extent, by individuals (47th in the Individuals sub-pillar). The Russian Federation holds several top 15 indicator scores within the People pillar: Active mobile broadband subscriptions (7th), Tertiary enrollment (14th), Adult literacy rate (9th), Professionals (12th), and Annual investment in telecommunication services (11th). Within the Technology pillar,

## Detailed Results

the Russian Federation shows comparative strength towards Access (33rd) and Content (40th) sub-pillars. For scores in the Impact pillar, a weak performance in the Quality of Life (89th) indicator dissipates the solid results in the Economy (45th) and SDG Contribution (43rd) sub-pillars. Governance is the Russian Federation's weakest dimension, and less robust showings in Regulation (118th) counterbalance decent scores in the Trust (38th) and Inclusion (31st) sub-pillars. ICT regulatory environment (125th), E-commerce legislation (123rd), and Privacy protection by law content (115th) indicators are clear areas of action for the economy.

**Armenia:** shows its best outcome within the People pillar (47th) due to widespread use of ICTs among individuals, governments, and even more so by businesses (a 52nd ranking for both the Individuals and Governments sub-pillars, and a 45th ranking position for Businesses). In particular, Armenia's adult literacy rate is noted as one of the highest, scoring eighth place in the Adult literacy rate indicator. The Technology pillar (58th) displays diverse outcomes, with the relatively solid performance in the Future Technologies (55th) and creation of digital Content (49th) sub-pillars diminished by a not so strong showing in Access (68th). The affordability of mobile tariffs and devices could benefit from prioritization to boost Access sub-pillar scores, though Armenia does display excellence in population covered by at least a 3G mobile network and Internet access in schools (both indicators earn 1st place rankings). Armenia can improve its overall score in the Governance pillar (72nd) through adjustments within the Trust sub-pillar. E-commerce regulation (76th in the E-commerce legislation indicator) and the socioeconomic divide in reference to the use of digital payments (94th in the Socioeconomic gap in the use of digital payments indicator) are additional areas of further development.

**Kazakhstan:** displays its strongest performance in the People pillar (54th), reflecting the continued adoption of ICTs by businesses (52nd in the Business sub-pillar) and a slightly less strong performance by individuals and governments (61st in both sub-pillars). In the Impact pillar (58th), improvements in happiness capture the country's efforts to reduce Income inequality (42nd in the Happiness indicator and 12th in the Income inequality indicator). Still, Kazakhstan could expand its network readiness impact by using digital technologies to increase the life expectancy at birth, increasing a 75th ranking placement in the Healthy life expectancy at birth indicator. Contributing to clean energy can also improve the 118th rank the country scored in the Affordable and Clean Energy indicator. Kazakhstan's performance in Technology (68th) captures good scores in the Access pillar (53rd), but low creation of digital content (73rd in the Content sub-pillar) and the promotion of future technologies (96th in the Future Technologies sub-pillar) lower performance scores. At the indicator level, improvement in the rate of Adoption of emerging technologies (84th) and Computer software spending (114th) are areas in need of action.

### Europe

The Netherlands, Sweden, and Denmark are the top three performers in the region of Europe. Find detailed remarks about each country in the Top 10 NRI performers section on page <Insert Page>. France (14th) and Austria (15th) demonstrated performance rank improvements in the 2021 NRI that deserve further analysis.

**France:** earns a 14th place ranking in the Technology, People, and Impact pillars, in addition to a 16th in Governance. Within the Technology pillar, improvements in the SMS sent (4th) and Handset prices (11th) indicators resulted in a good score in the Access sub-

## Detailed Results

pillar (16th), even though the country can improve upon its mobile network access (51st in the Population covered by at least a 3G network indicator). In the People pillar, France stands out as a world-class leader in its usage of open data (scoring 3rd in the Publication and use of open data indicator). The country also performs well in the Annual investment in telecommunication services (4th) and the Technicians and associate professionals (5th) indicators, earning high scores for an economy ranked outside the top 10. France also demonstrates strong performance scores within the Governance pillar because of its progressive regulatory frameworks for ICTs (11th rank in the Regulation sub-pillar). Several indicator scores prop up high Governance and Regulation rankings: Legal framework's adaptability to emerging technologies (9th), ICT regulatory environment (8th), and E-commerce legislation (1st). France can further improve overall scores by enhancing the Inclusion sub-pillar ranking (17th) and eradicating the gender gap in Internet use (53rd in the Gender gap in Internet use indicator).

**Austria:** is another European economy with a top performance in network readiness, achieving a 15th overall ranking. While Austria remains outside the top 10, it does earn top 20 scores in all pillars led by a 10th place showing in the People pillar. High levels of ICT engagement contribute to the positive performance in the People sub-pillar (11th in Businesses, 13th in Governments, 18th in Individuals). Several indicator rankings support such advanced ICT engagement: 5th in the Firms with a website indicator, 7th in the Government online services indicator, 7th in the GERD performed by business enterprise indicator, and 7th in R&D expenditure by governments and higher education indicator. Austria is also a global leader with regards to the development of mobile apps (1st in the Mobile applications development indicator) and mobile tariffs (7th in the Mobile tariffs

indicators), resulting in a 17th position in the Technology pillar. Still, the country could improve its mobile network coverage, where it scored 70th in Population covered by at least a 3G mobile network indicator. In the Governance pillar (18th), positive scores in the E-participation (6th) and the Rural gap in the use of digital payments (9th) indicators result in a 12th place ranking in the Inclusion sub-pillar (12th). However, the gender gap in internet use is still a notable issue that needs attention for overall improvement (58th rank in the Gender gap in Internet use indicator).. Austria's Impact pillar (19th) benefits from strong performances in the Quality of life (11th) and Happiness (11th) indicators, but more work towards the GDP per person engaged (89th) and the prevalence of the local gig economy (78th) is necessary. While Austria's SDG Contribution sub-pillar ranking (29th) reflects sustainably built cities (18th in the Sustainable cities and communities indicator) and healthy local communities (25th in the Good Health and Well-being indicator), the country can improve its overall score with improvements in the Females employed with advanced degrees indicator (36th) and the Affordable and Clean Energy (39th) indicators.

### The Americas

The United States leads the region of the Americas. Find a detailed analysis on the performance of the US in the Top 10 NRI performers section on page <INSERT PAGE>. Canada (11th) and Chile (44th) follow the US in second and third place within the region. Improved performances by Brazil and Mexico deserve further additional insight.

**Canada:** scores one rank outside the top 10 in the NRI 2021. The country boasts a well-rounded overall performance by earning top 20 rankings across all pillars. Canada's best performance scores relate to the Governance pillar (6th), which is boosted by global

## Detailed Results

leadership in inclusion (2nd in the Inclusion sub-pillar) in addition to high levels of trust (7th in the Trust pillar) and regulation (16th in the Regulation sub-pillar). Canada demonstrates strong indicator scores with a first-place rank in E-commerce legislation (1st) and a reduced Socioeconomic gap in the use of digital payments (3rd), even though weaker showings in the ICT regulatory environment (60th) slightly offset positive ranks. Canada's Technology pillar (9th) shows strong overall ICT access (11th in the Access sub-pillar), high-levels of digital content creation (10th in the Content sub-pillar), and robust investments in emerging technology (10th in the Future Technologies sub-pillar). Canada does show comparative weakness in the Impact pillar (20th), where solid economic performance (20th in the Economy sub-pillar) and a high quality of life (19th in Quality of Life sub-pillar) is somewhat slowed by relatively weaker showings in the SDG Contribution sub-pillar (32nd), particularly with respect to SDG 7: Affordable and Clean Energy indicator (111th).

**Chile:** earned third place in the Americas region with a positive performance score in the People pillar (38th). The widespread adoption of ICTs among individuals resulted in a 16th place rank in the Individual sub-pillar, even when a surprisingly low usage of digital technologies by businesses (46th) and governments offset the high grade (46th in the Businesses sub-pillar and 54th in Governments). Chile's Technology pillar score (54th) could benefit from less stringent mobile tariffs (56th in Mobile tariffs indicator), a higher volume of device use (85th in the SMS sent indicator), and more thorough mobile network coverage (82nd in the Population covered by at least a 3G mobile network indicator). The impact of ICTs on Chilean society displays significant room for improvement (61st in the Impact pillar), with all three sub-pillars scoring outside the top 50 economies (61st in Economy, 63rd in Quality

of Life, and 66th in SDG Contribution 66th). A focus on eradicating income inequality and increasing the number and quality of sustainable living centers can improve the scores of Income inequality (97th) and Sustainable Cities and Communities (69th) indicators for a better overall Impact ranking.

**Brazil:** placed outside the top 50 countries with a 52nd overall position. Brazil earned its strongest showing in the People pillar, though it displays diverse sub-pillar and indicator outcomes. On the one hand, the country demonstrates significant levels of ICT adoption by governments and businesses, scoring 29th and 38th in each respective sub-pillar. On the other hand, it shows somewhat low levels of digital engagement by individuals (67th in the Individuals sub-pillar), even with a sixth-place score in the Active mobile broadband subscriptions indicator. Another relatively strong pillar dimension of Brazil includes Governance (49th), with solid scores in the Inclusion sub-pillar (44th) that is boosted by increased e-participation (18th in the E-participation indicator) and a reduced rural gap regarding the use of digital payments (29th in the Rural gap in the use of digital payments indicator). Conversely, weaker sub-pillar rankings in Trust (54th) and Regulation (50th) prevent higher overall pillar scores. Brazil can improve most within the Impact pillar (70th), where low ranks in the Quality of Life (96th) and Income inequality (112th) indicators dampen achievements in Economy (55th) and SDG Contribution (59th).

**Mexico:** (59th overall rank) is the third-largest economy in the region and shows one of the most improved performances in the NRI 2021. Mexico's best outcome is in the People pillar (49th), where the country boasts a high number of digitally engaged individuals (33rd in the Individuals sub-pillar) due to plenty of active mobile broadband subscriptions (8th in the Active Mobile broadband subscriptions

## Detailed Results

indicator). A similar performance in the Governments sub-pillar (37th) stems from a high score in the Publication and use of open data indicator (11th). Still, Mexico faces challenges with regards to the adoption of ICTs by businesses (83rd in the Businesses sub-pillar) due to a low number of technicians (69th in the Technicians and associate professionals indicators), a limited number of firms that offer a website (82nds in the Firms with websites indicator), and minimal GERD performed in the business sector (67th in the GERD performed by business enterprise indicator). In the Impact pillar (56th), Mexico displays a robust digital economy (51st in the Economy sub-pillar) via its global leadership in High-tech exports (8th) and High-tech and medium-high-tech manufacturing (12th) indicators. However, the country struggles to maintain a consistent GDP growth rate (108th in GDP per person engaged). Mexico also

shows a mixed outcome in the Technology pillar (65th), where relatively dismal scores in the Future Technologies sub-pillar deter strong Access sub-pillar scores (55th). The affordability of devices (32nd in the Handset prices indicator) and device use (12th in the SMS sent by population indicator) prop up the Access sub-pillar. Significant room for improvement is also evident when it comes to the Quality of Life sub-pillar (68th), where Income inequality (100th) and Healthy life expectancy at birth (71st) indicators rank among the lowest of similar-sized economies. Mexico worst performance occurs in the Governance pillar (70th), where weak levels of inclusion and trust towards digital technologies (90th in the Inclusion sub-pillar and 72nd in the trust sub-pillar) hurt positive showings in the E-commerce legislation (1st) and Privacy protection by law content (27th) indicators.

# Country/ Economy Profiles

# Country/Economy Profiles

## How to read the Country/Economy Profiles

The Country/Economy Profiles presents a scorecard that summarizes the individual performance of each economy (130 total) covered in The Network Readiness Index 2021.

Each Country/Economy Profile consists of three parts:

### 1. PERFORMANCE HIGHLIGHTS

The first section displays each Country/Economy's overall performance across the NRI, the four primary pillars, and the twelve sub-pillars. For each level of the NRI, the economy's ranking (out of the 130 economies) and individual score (on a 0-to-100 scale) is shown.

### 2. RADAR CHART

The second section uses a radar chart to visually depict the individual economy's performance in the overall NRI, its four pillars, and sub-pillars. The blue line plots the economy's score, while the gray line represents the average score of all economies found in the same income class. The World Bank defines each country's income classification and reflects data current to July 2021.

### 3. DETAILED NETWORK READINESS INDEX REPORTING

The third section demonstrates how a particular economy performed across each of the 60 indicators comprising the NRI. All indicators organize into primary and secondary level pillars, and their numbering matches the data tables found in the other report sections with additional information such as descriptions, years, rankings, values, and normalized scores for all the indicators.

# Country/Economy Profiles

## STRENGTHS AND WEAKNESSES

The indicators considered a strength of a particular economy are notated on the far right-hand side by a solid circle. Indicators signaled as a weakness receive a hollow circle. For all economies, indicators with rankings of 1, 2, and 3 are highlighted as strengths, while indicator rankings of 128, 129, and 130 represent weaknesses.

For any remaining indicators, the strengths and weaknesses of a particular economy are based on the percentage of economies with scores that fall above or below a score determined by percent ranks. Indicators highlighted as strengths earn a score in the 10th largest percent rank among the 60 possible indicators of each economy. Indicators highlighted as weaknesses include scores that rank below the 5th lowest percent rank of the 60 indicators.

## THE NRI ONLINE

The NRI website (<https://networkreadinessindex.org/>) offers additional analysis, analytical tools, individual country/economy profiles, and visualizations such as sortable rankings and maps.

## Structure of the Network Readiness Index

Since network readiness is a multi-dimensional concept, the Network Readiness Index (NRI) is a composite index constructed with three levels. The primary level consists of four pillars that make up the fundamental dimensions of network readiness. Each of the fundamental pillars divides into additional sub-pillars that constitute the second level.

- Technology: Access, Content, Future Technologies
- People: Individuals, Businesses, Governments
- Governance: Trust, Regulation, Inclusion
- Impact: Economy, Quality of Life, Sustainable Development Goal (SDG) contribution.

The third level consists of individual indicators distributed across the different sub-pillars and pillars of the primary and secondary levels. All indicators used within the NRI belong to a pillar and a sub-pillar.

For record-keeping, a three-digit code identifies each indicator. The first digit refers to the primary pillar, the second digit concerns the secondary sub-pillar, and the third denotes the indicator itself. For instance, the digital code 1.2.3 refers to an individual indicator (internet domain registrations) located within the first primary pillar (Technology) and the secondary sub-pillar (Content).

The third level of the NRI 2021 consists of 60 indicators. 33 indicators are hard/quantitative data, 11 are index/composite indicator data, and 16 are survey/qualitative data.

The complete structure of the NRI with its respective pillars, sub-pillars, and indicators is shown on the next page.

Primary Level	Technology	People	Governance	Impact
Secondary Level	Access Content Future Technologies	Individuals Businesses Governments	Trust Regulation Inclusion	Economy Quality of Life Sustainable Development Goal (SDG) contributions

		4.3.5 SDG 11: Sustainable cities and communities	

# Appendix I: Technical Notes

## Box A-I.1: GitHub commits as a measurement of online digital development

In the past two editions of the Network Readiness Index, the Portulans Institute introduced an indicator to the Content primary pillar collection that measures GitHub commits per 1,000 population. The rationale behind this particular indicator is twofold: first, it highlights that GitHub is the world's largest host of source code. Second, it shows that code and activity on the platform is a proxy for the degree of software development and digital content creation happening online. A "commit" can be likened to a saved change, hence an aggregate value of "GitHub commits" refers to the number of individual changes occurring on the platform.

There are two identifiable limitations to the Github commits indicator data. First, it only covers commits available for public viewing and therefore does not include commits made in private repositories. Second, users of GitHub are not required to indicate where they are based, and only a minority of users register their country of residence.<sup>[i]</sup>

Table A-I B.1 and Table A-I B.2 show, respectively, the countries and cities with the most frequent GitHub commits in 2018 (in absolute numbers).<sup>[ii]</sup> Each table also shows the region and income group of the places signaled in both top 10 lists.

## Appendix I: Technical Notes

**TABLE A-I.B.1: TOP 10: REPORTED NUMBER OF GITHUB COMMITS AGGREGATED PER ECONOMY 2018**

Economy	Other region	Income	GitHub commits	Rank
The United States of America	The Americas	High-income	31,588,973	1
Germany	Europe	High-income	6,574,037	2
China	Asia & Pacific	Upper-middle-income	6,373,716	3
The United Kingdom	Europe	High-income	6,221,964	4
France	Europe	High-income	4,381,647	5
Canada	The Americas	High-income	3,521,388	6
India	Asia & Pacific	Lower-middle-income	3,448,020	7
Russian Federation	CIS	Upper-middle-income	2,708,861	8
Brazil	The Americas	Upper-middle-income	2,670,057	9
Japan	Asia & Pacific	High-income	2,394,774	10

**TABLE A-I.B.2: REPORTED NUMBER OF GITHUB COMMITS AGGREGATED PER CITY 2018 (SHOWING ALSO ECONOMY, REGION, AND INCOME GROUP)**

City	Economy	Other region	Income	GitHub commits
London	The United Kingdom	Europe	High-income	2,705,044
New York	The United States of America	The Americas	High-income	2,441,317
San Francisco	The United States of America	The Americas	High-income	2,153,068
Paris	France	Europe	High-income	1,842,668
Berlin	Germany	Europe	High-income	1,441,875
Seattle	The United States of America	The Americas	High-income	1,412,372
Beijing	China	Asia & Pacific	Upper-middle-income	1,386,717
Tokyo	Japan	Asia & Pacific	High-income	1,144,619
Shanghai	China	Asia & Pacific	Upper-middle-income	1,135,398
Los Angeles	The United States of America	The Americas	High-income	991,233

# Appendix I: Technical Notes

## Adjustments to the Network Readiness Index model in 2021

Table A-I.2 provides a summary of adjustments to the NRI 2021 framework. A total of 15 indicators were modified this year. The

methodology of three indicators changed, three are new indicators, two indicators were dropped, six indicators were introduced to replace previous indicators, and one indicator changed code.

Variable code	NRI 2020	Adjustment	New code	NRI 2021
114	4G mobile network coverage	Replaced	114	SMS sent by population 15-69
		New indicator	115	Population covered by at least a 3G mobile network, %
		New indicator	125	AI Publications (count)
133	ICT PCT Patent applications	Removed		
135	Robot density	Changed code	133	Robot Density
211	Internet users	Replaced	211	Active mobile broadband subscriptions (count)
212	Active mobile-broadband subscriptions	Removed		
222	Ease of doing business	Replaced	222	GERD Finance by Business
225	Business use of digital tools	Replaced	225	Annual investment in Telecommunication
226	R&D expenditure by businesses	Replaced	226	GERD Performed by Business
411	Medium and high-tech industry	Methodology revised	411	Medium and high-tech manufacturing, %
412	High-tech exports	Methodology revised	412	High-tech exports, % total trade
414	Labor productivity per employee	Methodology revised	414	Labor productivity growth, %
		New indicator	416	ICT Services Exports
433	SDG 5: Gender Equality	Replaced	433	Females employed with advanced degrees, %

# Appendix I: Technical Notes

## Country and data coverage

The inclusion of countries and indicators relies on the double threshold approach. Only countries that could provide data for at least 70% of all indicators earned inclusion to the NRI. In addition, countries needed to pass a sub-pillar level data availability of at least 40% for coverage. Only indicators with data available for at least 50% of all countries gained inclusion to the NRI. Missing values received a “N/A” label and did not count within the computation of scores.

## Treatment of series with outliers

Outliers in an indicator can affect ranking results with bias. It is prudent to detect and remove all outliers before the normalization of scores. An applied rule-of-thumb where an absolute value of skewness greater than 2 and a kurtosis greater than 3.5 indicates the presence of outliers.[i]

The treatment of outliers occurs in two ways. First, indicators with no more than four outliers are winsorized, whereby the value affecting the distribution assigns to the next highest/lowest value method. The winsorization process continues until the reported skewness and/or kurtosis fall within the ranges specified above.

Second, indicators with at least five outliers are transformed by natural logarithms according to the following formula:

$$\ln \left[ (max \times f_{actor} - 1) \times \frac{(value - min)}{(max - min)} + 1 \right]$$

For the NRI 2021, outliers were detected in fourteen indicators. Five indicators[ii] had fewer than five outliers and nine indicators[iii] had five outliers or more.

## Normalisation

To make the indicators comparable for data aggregation, they must go through a process of normalization. The NRI applies the Min-max normalization method to ensure all values fall into the [0, 100] range/. For indicators where higher values indicate higher outcomes the following normalization formula is applied:

$$100 \times \frac{(value - min)}{(max - min)}$$

For indicators where higher values imply worse outcomes the following reverse normalization formula is applied:[iv]

$$100 \times \frac{(max - value)}{(max - min)}$$

---

[ii] 1.2.3 Internet domain registrations; 1.3.3 Robot density; 3.3.4 Gender gap in internet use; 4.1.2 High-tech exports; 4.3.3. Females employed with advanced degrees; and 4.3.4 SDG 7: Affordable and clean energy.

[iii] 1.1.6 International internet bandwidth; 1.3.4 Computer software spending; and 3.1.3 Online access to financial account.

[iv] For the NRI 2021 reverse normalisation was needed for two indicators: 4.2.3 Income inequality and 4.3.4 SDG 7: Affordable and clean energy.

# Appendix II: Sources and Definitions

# Appendix II: Sources and Definitions

## 1st pillar: Technology

### 1.1 Access

#### 1.1.1 Mobile tariffs

##### Mobile tariffs sub-index | 2018

The Mobile Tariffs indicator refers to the Mobile tariffs sub-index included in the Affordability pillar of the Mobile Connectivity Index published by the GSM Association. The sub-index relates to the cost of three separate basket profiles that are distinguished in part by usage allowance (100 MB, 500 MB, and 1 GB per month, respectively). Tariffs are given as a percentage of monthly GDP per capita. The primary source for the data is Tarifica (<https://tarifica.com/>).

Source: GSM Association. "The GSMA Mobile Connectivity Index 2019." <http://www.mobileconnectivityindex.com>

#### 1.1.2 Handset prices

##### Cost of the cheapest internet-enabled device (% of monthly GDP per capita) | 2018

As one of the indicators included in the Affordability pillar of the Mobile Connectivity Index published by the GSM Association, the Handset prices indicator relates to the cheapest smartphone or feature phone that allows user access to the Internet. The primary source for the data is Tarifica (<https://tarifica.com/>).

Source: GSM Association. "The GSMA Mobile Connectivity Index 2019." <http://www.mobileconnectivityindex.com>

#### 1.1.3 Households with Internet access

##### The estimated proportion of households with Internet access at home (%) | 2020

The Households with Internet access indicator can include both estimates and survey data corresponding to the proportion of households with Internet. The Internet is

a worldwide public computer network that provides access to several communication services via the World Wide Web and carries email, news, entertainment, and data files. Computer-only access is not assumed and may extend to mobile phones, game machines, digital televisions, and other digital formats. Proportional score calculations result from the number of in-scope households with Internet access divided by the total number of in-scope households.

Source: International Telecommunication Union (ITU). "ITU World Telecommunication/ICT Indicators database 2021." July 2021. <http://www.itu.int/en/ITU-D/Statistics/Pages/publications/wtid.aspx>

#### 1.1.4 SMS sent by population 15-69

##### SMS sent | 2020

SMS sent refers to the total number of mobile short-message service (SMS) messages initiated to and from national and international destinations. The indicator excludes messages sent from computers to mobile handsets or other computers. Values scale by population between the ages of 15 and 69.

Source: International Telecommunication Union (ITU). "ITU World Telecommunication/ICT Indicators database 2021." July 2021. <http://www.itu.int/en/ITU-D/Statistics/Pages/publications/wtid.aspx>

#### 1.1.5 Population covered by at least a 3G mobile network

##### Percentage of the population covered by at least a 3G mobile network | 2020

The following indicator refers to the percentage of inhabitants within range of at least a 3G mobile-cellular signal, irrespective of whether or not they are subscribers. Values are calculated by dividing the number of

## Appendix II: Sources and Definitions

inhabitants covered by at least a 3G mobile-cellular signal by the total population and multiplied by 100.

Source: International Telecommunication Union (ITU). "ITU World Telecommunication/ICT Indicators database 2021." July 2021. <http://www.itu.int/en/ITU-D/Statistics/Pages/publications/wtid.aspx>

### 1.1.6 International Internet bandwidth

International Internet bandwidth (Mbit/s) | 2020

International Internet bandwidth refers to the total used capacity of international Internet bandwidth in megabits per second (Mbit/s). Calculations only include the total usage capacity of all Internet exchanges (locations that exchange Internet traffic) that offer international bandwidth. If capacity is asymmetric and there is more incoming (downlink) than outgoing (uplink) capacity, then the incoming (downlink) capacity is provided.

Source: International Telecommunication Union (ITU). "ITU World Telecommunication/ICT Indicators database 2021." July 2021. <http://www.itu.int/en/ITU-D/Statistics/Pages/publications/wtid.aspx>

### 1.1.7 Internet access in schools

The proportion of primary schools with access to Internet for pedagogical purposes (%) | 2020

The Internet access in schools indicator refers to the share of primary schools with access to the Internet via fixed narrowband, fixed broadband, or mobile networks. Internet for pedagogical purposes refers to web access and communications services through various devices that enhance the teaching and learning of pupils.

Source: UNESCO Institute for Statistics. "UIS. Stat" <http://data.uis.unesco.org/>

## 1.2 Content

### 1.2.1 GitHub commits

GitHub commits per 1,000 population | 2018

GitHub is a large host of source code, and commits are known as any saved changes initiated on the platform. As such, the GitHub commits indicator refers to the number of publicly available commits on the GitHub website. Since only a minority of GitHub users are geolocated, the data is limited because the indicator does not represent total Github commits. However, as pointed out in Ojanperä, Graham, and Zook (2019),<sup>[i]</sup> since the data limitation probably does not entail any geographic bias, the indicator is "an appropriate, if imperfect, proxy for otherwise hard to measure programming skills."

Source: Gousios, Georgios. "The GHTorrent dataset and tool suite." 2013. MSR 2013: 233-236. <http://data.worldbank.org/data-catalog/world-development-indicators>. Data accessed through Google BigQuery. World Development Indicators are the primary source for population data.

[i]Sanna Ojanperä, Mark Graham & Matthew Zook (2019) The Digital Knowledge Economy Index: Mapping Content Production, The Journal of Development Studies, 55:12, 2626-2643, DOI: 10.1080/00220388.2018.1554208)

### 1.2.2 Wikipedia edits

Wikipedia yearly page edits (per million population 15–69 years old) | 2020

All data extracts from internal sources provided by The Wikimedia Foundation. A country with edit counts in 2020 greater than 100,000 use data from that year. All data reports per million population aged

## Appendix II: Sources and Definitions

15–69 years old. Data collected from China is considered missing and classified as “n/a.”

Source: Wikimedia Foundation; United Nations, Department of Economic and Social Affairs, Population Division. World Population Prospects: The 2019 Revision (population). (<https://wikimediafoundation.org>; <https://esa.un.org/unpd/wpp>).

### 1.2.3 Internet domain registrations

Generic top-level domains (gTLDs) and country-code top-level domains (ccTLDs) per person | 2020

The Internet domain registrations indicator measures the production of Internet content. It refers to two types of top-level domains: generic top-level domains and country-code top-level domains. The gTLDs cover domain names that use .com, .net, .org, .biz, .info, and .mobi. Similar to Ojanperä, Graham and Zook (2019)[ii], a small number of countries are excluded because the high volume reported from their ccTLDs is due to the specific meaning of the domain rather than any content produced in the country itself (e.g. the use of Tuvalu.tv domain by the entertainment industry).

Source: Data on Internet domain registrations kindly provided by ZookNIC. World Development Indicators provide data on population. (<http://data.worldbank.org/data-catalog/world-development-indicators>).

[ii]Sanna Ojanperä, Mark Graham & Matthew Zook (2019) The Digital Knowledge Economy Index: Mapping Content Production, The Journal of Development Studies, 55:12, 2626–2643, DOI: 10.1080/00220388.2018.1554208)

### 1.2.4 Mobile apps development

Number of active mobile applications developed per person | 2018

The Mobile app development indicator sources the Mobile Connectivity Index published by the GSM Association. As part of the Content & services primary pillar, it is one of four indicators located within the Local Relevance sub-index. All original data sourced from AppFigures (<https://appfigures.com/>).

Source: GSM Association. “The GSMA Mobile Connectivity Index 2019.” <http://www.mobileconnectivityindex.com>

### 1.2.5 AI scientific publications

Total number of AI scientific publications, count | 2020

The AI scientific publications indicator measures the total number of AI publications in Elsevier per economy. Any paper with a field of study categorized as “artificial intelligence” and “machine learning” according to the Microsoft Academic Graph (MAG) taxonomy is measured. Results from other fields of study, such as “natural language processing”, “speech recognition”, and “computer vision” are included if they also belong to the “artificial intelligence” or the “machine learning” fields of study. As such, the results are likely to be conservative. Tagging occurs through a concept detection operation.

The Microsoft Academic Graph (MAG) is a heterogeneous graph containing scientific publication records and citation relationships between each publication from authors, institutions, journals, conferences, and fields of study (Sinha et al., 2015; Wang et al., 2019).

Source: OECD. “Elsevier (Scopus) for bibliometrics.” OECD.AI Policy Observatory <https://oecd.ai>

## 1.3 Future technologies

### 1.3.1 Adoption of emerging technologies

## Appendix II: Sources and Definitions

Average answer to a survey question concerning the extent that companies adopt five types of emerging technology | 2018-19

The annual World Economic Forum's Executive Opinion Survey (EOS) gathers information from business leaders on topics with scarce or non-existent data. It is part of the effort to supplement The Global Competitiveness Report in assessing issues that drive national competitiveness.

The Adoption of emerging technologies indicator refers to the average answer of a similarly-worded question posited by the EOS regarding five different emerging technologies (Artificial intelligence, Robotics, App- and web-enabled markets, Big data analytics, and Cloud computing):

"In your country, to what extent are companies adopting Artificial intelligence?" (1: not at all; 7: to a great extent - on par with the most technologically advanced economies)

Source: World Economic Forum. "Executive Opinion Survey 2018-2019." <http://reports.weforum.org>

### 1.3.2 Investment in emerging technologies

Average answer to a survey question concerning the extent that companies invest in emerging technologies. | 2017-18

The annual World Economic Forum's Executive Opinion Survey (EOS) gathers information from business leaders on topics with scarce or non-existent data. It is part of the effort to supplement The Global Competitiveness Report in assessing issues that drive national competitiveness.

The Investment in emerging technologies indicator refers to the average answer of a similarly-worded question posited by the EOS regarding five different emerging technologies (Artificial intelligence, Robotics, App- and web-enabled markets, Big data analytics, and Cloud computing):

"In your country, to what extent do companies invest in emerging technologies (e.g., Internet of Things, advanced analytics and artificial intelligence, augmented virtual reality and wearables, advanced robotics, 3D printing)?" [1 = not at all; 7 = to a great extent]

Source: World Economic Forum. "Executive Opinion Survey 2018-2019." <http://reports.weforum.org>

### 1.3.3 Robot density

Number of robots in operation per 10,000 employees in the manufacturing industry | 2019

Robot density refers to the estimated number of multipurpose industrial robots per 10,000 persons employed in the manufacturing industry (ISIC rev.4: C). The International Federation of Robotics (IFR) collects country-level data on the operational stock of industrial robots and for certain countries computes robot densities. The annual World Robotics report publishes computed robot densities.

Source: Data on robot density and operational stock of industrial robots for 2019 kindly provided by the International Federation of Robotics (IFR, <https://ifr.org>). Data on employment in manufacturing in the countries for which IFR has not computed robot densities source the International Labour Organization, ILOSTAT (<https://ilostat.ilo.org/>)

### 1.3.4 Computer software spending

Total computer software spending (% of GDP) | 2020

Computer software spending refers to the total value of purchased or leased packaged software, including operating systems, database systems, programming tools, utilities, and applications. The indicator

## Appendix II: Sources and Definitions

excludes expenditures for internal software development and outsourced custom software development. The data combines actual figures and estimates. Reporting occurs as a percentage of an economy's GDP.

Source: IHS Markit. "Information and Communication Technology Database". (<https://www.ihs.com/index.html>).

## 2nd pillar: People

### 2.1 Individuals

#### 2.1.1 Active mobile broadband subscriptions

Active mobile-broadband subscriptions | 2020

The Active mobile broadband subscriptions indicator measures the sum of standard mobile-broadband and dedicated mobile-broadband subscriptions to the public Internet. It covers actual subscribers and excludes potential subscribers, even though the latter may have broadband enabled-handsets.

Source: International Telecommunication Union (ITU). "ITU World Telecommunication/ICT Indicators database 2021." July 2021. <http://www.itu.int/en/ITU-D/Statistics/Pages/publications/wtid.aspx>

#### 2.1.2 ICT skills

Average answer to a survey question concerning the extent that a country possesses sufficient digital skills. | 2018-19

The annual World Economic Forum's Executive Opinion Survey (EOS) gathers information from business leaders on topics with scarce or non-existent data. It is part of the effort to supplement The Global Competitiveness Report in assessing issues that drive national competitiveness.

The ICT skills indicator refers to the average answer of a similarly-worded question posed by the EOS regarding the digital skills of a country:

"In your country, to what extent does the active population possess sufficient digital skills (e.g., computer skills, basic coding, digital reading)?" [1 = not at all; 7 = to a great extent]

Source: World Economic Forum. "Executive Opinion Survey 2018-2019." <http://reports.weforum.org>

#### 2.1.3 Use of virtual social networks

Number of active social media users (% of the population) | 2019

The Use of virtual social networks indicator refers to the penetration of active social media users expressed as a percentage of the total population. Original data comes from a variety of sources, including company statements and reports in reputable media.

Source: We Are Social and Hootsuite. "Global Digital Report 2020." 2020. <https://wearesocial.com/digital-2020>

#### 2.1.4 Tertiary enrollment

Gross enrollment ratio, tertiary education (%) | 2020

Tertiary enrollment refers to the ratio of total education enrollment, regardless of age, by the population of the age group that officially corresponds to the expected level of tertiary education. Tertiary education often requires the successful completion of education at the secondary level as a minimum condition

## Appendix II: Sources and Definitions

of admission. The International Standard Classification of Education (ISCED) defines the standards of the tertiary level.

Source: UNESCO Institute for Statistics. "UIS. Stat." UNESCO. <http://data.uis.unesco.org/>

### 2.1.5 Adult literacy rate

Adult literacy rate (%) | 2020

The Adult literacy rate indicator defines the percentage of the population aged 15 years and over who can read, write, and understand short, simple statements about their everyday life.

Source: UNESCO Institute for Statistics. "UIS. Stat." UNESCO. <http://data.uis.unesco.org/>

## 2.2 Businesses

### 2.2.1 Firms with website

Firms with a website (% of total) | 2018

The data for the Firms with website indicator consists of enterprise surveys conducted by the Organisation for Economic Co-operation and Development (OECD) and the World Bank. Data supplied by the OECD informs OECD countries, accession countries, or key partners, while all other country data sources the World Bank.

Source: OECD, ICT Access and Use by Businesses, OECD Telecommunications and Internet Statistics (database) (<https://doi.org/10.1787/9d2cb97b-en>)

Source: World Bank. "Enterprise Surveys." The World Bank. [www.enterprisesurveys.org](http://www.enterprisesurveys.org)

### 2.2.2 GERD financed by business enterprise

GERD: Financed by business enterprise (% of total GERD) | 2019

The following indicator refers to the Gross expenditure on R&D (GERD) financed by a

business enterprise as a percentage of total gross R&D expenditure. GERD or Intramural R&D expenditure consists of all spent funds on R&D performed within a statistical unit or sector of the economy during a specific period, regardless of the funding source. Of note, Bolivia and Burkina Faso use data from 2009.

Source: UNESCO Institute for Statistics (UIS) online database; Eurostat, Eurostat database; OECD, Main Science and Technology Indicators (MSTI) database, 2019 (2010-19). (<http://data.uis.unesco.org>; <https://ec.europa.eu/eurostat/data/database>; [https://stats.oecd.org/Index.aspx?DataSetCode=MSTI\\_PUB](https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB)).

### 2.2.3 Professionals

Professionals (%) | 2019

The professionals indicator refers to the number of professionals as a share of the total workforce. Employment by occupation data sources the International Standard Classification of Occupation (ISCO) Revision 2008 (countries where ISCO Rev. 2008 is unavailable use data based on ISCO Rev. 1988). Employment categories include:

- Physical, mathematical, and engineering science professionals
- Life science and health professionals
- Teaching professionals
- Other professionals in business, legal, social sciences, and creative or performing arts in addition to archivists, librarians, and writers

Source: International Labour Organization, ILOSTAT. 2020. <https://ilostat.ilo.org/>

### 2.2.4 Technicians and associate professionals

Technicians and associate professionals (%) | 2019

The technicians and associate professionals

## Appendix II: Sources and Definitions

indicator refers to the number of technicians and associate professionals as a percentage of the total workforce. Employment by occupation data follows the International Standard Classification of Occupation (ISCO) Revision 2008 (countries where ISCO Rev. 2008 is unavailable use data based on ISCO Rev. 1988). Employment categories include:

- Physical and engineering science associate professionals
- Life science and health associate professionals
- Teaching associate professionals
- Other associate professionals in finance and sales, administrative, customs, entertainment and sports, and social work in addition to religious associate professionals, police inspectors, detectives, and tax and related government associate professionals.

Source: International Labour Organization, ILOSTAT. 2020. <https://ilostat.ilo.org/>

### 2.2.5 Annual investment in telecommunication services

Annual investment in telecommunication services (US\$) | 2020

The Annual investment in telecommunication services indicator refers to the investments made within the financial year by entities that provide telecommunication networks and/or services (including fixed mobile and Internet services and the transmission of TV signals). Investments are considered any spent funds on the acquisition and upgrading of assets (usually referred to as CAPEX) less disinvestment owing to disposals. Fixed assets include tangible assets such as buildings and networks and intangible assets such as computer software and intellectual property.

The indicator corresponds to the gross

fixed capital formation concept defined in the System of National Accounts 2008. The indicator also includes expenditures on initial installations and additions to existing installations where the usage is expected over an extended period of time. It excludes expenditures on fees for operating licenses and the use of radio spectrum. All values are notated in US\$.

Source: International Telecommunication Union (ITU). "ITU World Telecommunication/ICT Indicators database 2021." July 2021. <http://www.itu.int/en/ITU-D/Statistics/Pages/publications/wtid.aspx>

### 2.2.6 GERD performed by business enterprise

GERD performed by business enterprise (% of GDP) | 2019

The indicator measures the gross expenditure on R&D performed by a business enterprise as a percentage of GDP. For the definition of GERD, see indicator 2.2.2.

Source: Science and Technology Indicators MSTI database, 2019. <http://data.uis.unesco.org/>; <https://ec.europa.eu/eurostat/data/database>; [https://stats.oecd.org/Index.aspx?DataSetCode=MSTI\\_PUB](https://stats.oecd.org/Index.aspx?DataSetCode=MSTI_PUB)

## 2.3 Governments

### 2.3.1 Government online services

Government Online Service Index | 2020

The Government Online Service Index (OIS) is a primary component of the E-Government Development Index (EGDI) that the United Nations Department of Economic and Social Affairs publishes. The OIS assesses the quality of a government's delivery of online services on a 0-to-1 (best) scale. Researchers create the assessment to evaluate "each country's national website in the native language,

## Appendix II: Sources and Definitions

including the national portal, e-services portal, and e-participation portal, as well as the websites of the related ministries of education, labor, social services, health, finance, and environment, as applicable.”

Source: United Nations Department of Economic and Social Affairs (UNDESA). UN E-Government Knowledgebase. <https://publicadministration.un.org/egovkb/en-us/>

### 2.3.2 Publication and use of open data

#### Open Data Barometer | 2016

The Open Data Barometer indicator refers to the fourth edition of the Open Data Barometer index that provides a measure of how governments publish and use open data based on readiness (35%), implementation (35%), and impact (30%).<sup>[iii]</sup>

[iii] Parenthesis note the weight of each dimension.

Source: World Wide Web Foundation. “Open Data Barometer 4th Edition – Global Report.” 2017. <https://opendatabarometer.org/4thedition/>

### 2.3.3 Government promotion of investment in emerging technologies

Average answer to survey questions concerning the extent to which governments foster investment in five types of emerging technology | 2018–19

The annual World Economic Forum’s Executive Opinion Survey (EOS) gathers information from business leaders on topics with scarce or non-existent data. It is part of the effort to supplement The Global Competitiveness Report in assessing issues that drive national competitiveness.

The following indicator refers to the simple mean of the average answer of a similarly-worded question posited by the EOS

regarding a government’s ability to foster investment in five emerging technology sectors (Artificial intelligence, Robotics, App- and web-enabled markets, Big data analytics, and Cloud computing):

“In your country, to what extent does the government foster investment (public and private) in artificial intelligence and machine learning?” (1: not at all; 7: to a great extent)

Source: World Economic Forum. “Executive Opinion Survey 2018–2019.” <http://reports.weforum.org>

### 2.3.4 R&D expenditure by governments and higher education

Gross domestic expenditure on R&D performed by government and higher education institutions (% of GDP) | 2020

The following indicator refers to the combined expenditure by governments and higher education institutions on research and development (R&D) as a percentage of GDP. The government sector comprises all central, regional, and municipal government units. It excludes all public enterprises (public enterprises fall under the business enterprise category). Higher education institutions include an organization whose primary focus is on providing formal tertiary education (i.e. levels 5–8 of the International Standard Classification of Education, ISCED). The definition of R&D expenditure involves all current expenditure plus gross fixed capital expenditure for R&D performed by government and higher education institutions, no matter the source of funds.

Source: UNESCO Institute for Statistics. “UIS. Stat” <http://data.uis.unesco.org/>

## Appendix II: Sources and Definitions

### 3rd pillar: Governance

#### 3.1 Trust

##### 3.1.1 Secure Internet servers

Secure Internet servers (per million population) | 2019

Secure Internet servers are servers that use encryption technology in Internet transactions.

Source: World Bank. "World Development Indicators" The World Bank. October 29, 2021. <http://data.worldbank.org/data-catalog/world-development-indicators>

##### 3.1.2 Cybersecurity

Global Cybersecurity Index | 2020

The Global Cybersecurity Index (GCI) measures the level of cybersecurity commitments made by individual countries. It is a composite index consisting of 25 indicators distributed across five main pillars: (1) Legal Measures, (2) Technical Measures, (3) Organizational Measures, (4) Capacity Building Measures, and (5) Cooperation Measures. Scores are standardized to a scale of 0-1.

Source: ITU 2021. "Global Cybersecurity Index (GCI) 2020." 2020. <https://www.itu.int/epublications/publication/global-cybersecurity-index-2020/en/>

##### 3.1.3 Online access to financial account

People who used a mobile phone or the Internet to access a financial institution account in the past year (% with a financial institution account, age 15+) | 2017

The Online access to financial account indicator refers to the percentage of people who have a financial institution account that report using a mobile phone or the Internet to access their financial institution account within the past 12 months.

Source: World Bank, "Global Findex Database." The World Bank. <https://globalfindex.worldbank.org/>

##### 3.1.4 Internet shopping

People who used the Internet to buy resources online in the past year (%) | 2017

The Internet shopping indicator refers to the percentage of respondents aged 15 years and older who have used the Internet in the past year to purchase goods and services online. The data sources a triennial survey carried out in more than 140 economies.

Source: World Bank, "Global Findex Database." The World Bank. <https://globalfindex.worldbank.org/>

#### 3.2 Regulation

##### 3.2.1 Regulatory quality

Regulatory quality indicator | 2018

The regulatory quality indicator captures the perception of a government's ability to formulate and implement sound policies and regulations that permit and promote private sector development. Scores are standardized to a scale from -2.5 (worst) to 2.5 (best).

Source: World Bank. "Worldwide Governance Indicators 2019 Update." The World Bank. [www.govindicators.org](http://www.govindicators.org)

##### 3.2.2 ICT regulatory environment

ICT Regulatory Tracker | 2018

The ICT regulatory environment indicator is based on the ICT Regulatory Tracker composite index that provides a measure of the existence and features of ICT legal and regulatory frameworks. The index covers 50 indicators distributed across four pillars: (1)

## Appendix II: Sources and Definitions

Regulatory Authority, (2) Regulatory Mandate, (3) Regulatory Regime, and (4) Competition Framework. Scores are standardized to a scale of 0–2.

Source: International Telecommunication Union (ITU). “ICT Regulatory Tracker 2018.” <https://www.itu.int/net4/itu-d/irt/>

### 3.2.3 Legal framework’s adaptability to emerging technologies

Average answer to survey questions concerning the extent to which the legal framework is adapting to five types of emerging technology | 2018–19

The annual World Economic Forum’s Executive Opinion Survey (EOS) gathers information from business leaders on topics with scarce or non-existent data. It is part of the effort to supplement The Global Competitiveness Report in assessing issues that drive national competitiveness.

The Legal framework’s adaptability to emerging technologies indicator refers to the simple mean of the average answer of a similarly-worded question posited by the EOS regarding five different emerging technologies (Artificial intelligence, Robotics, App- and web-enabled markets, Big data analytics, and Cloud computing):

“In your country, how adequately is the legal framework adapting to artificial intelligence, robotics, app- and web-enabled markets, big data analytics, and cloud computing? (1: not at all; 7: to a great extent - the legal framework is up-to-date)

Source: World Economic Forum. “Executive Opinion Survey 2018–2019.” <http://reports.weforum.org>

### 3.2.4 E-commerce legislation

Global Cyberlaw Tracker | 2020

The E-commerce legislation indicator refers

to a country’s adoption of e-commerce legislation. The Global Cyberlaw Tracker provides information on whether a country has adopted legislation or has a draft law pending adoption within four areas: electronic transactions, consumer protection, privacy and data protection, and cybercrime. Scores range from 0 (no legislation) to 4 (adopted legislation in all four areas).

Source: United Nations Conference on Trade and Development (UNCTAD). “Global Cyberlaw Tracker.” UNCTAD. 2020. [https://unctad.org/en/Pages/DTL/STI\\_and\\_ICTs/ICT4D-Legislation/eCom-Global-Legislation.aspx](https://unctad.org/en/Pages/DTL/STI_and_ICTs/ICT4D-Legislation/eCom-Global-Legislation.aspx)

### 3.2.5 Privacy protection by law content

Average answer to the question “What does the legal framework to protect Internet users’ privacy and their data stipulate? | 2019

The Privacy protection by law content indicator refers to responses on privacy protection given by multiple country experts on a 0–4 scale. With disagreement and measurement error taken into account, aggregated responses compute a probability distribution over country-year scores on a standardized interval scale. Point estimates are the median values of each distribution for every country-year. The scale of a measurement model variable is similar to a normal (“Z”) score (e.g. typically between -5 and 5, with 0 approximately representing the mean for all country-years in the sample), though it does not necessarily follow a normal distribution. Data only includes estimates based on at least four ratings.

Source: Mechkova, Valeriya, Daniel Pemstein, Brigitte Seim, and Steven Wilson. “Digital Society Project Dataset v2”. Digital Society Project. 2021. <http://digitalsocietyproject.org>

## Appendix II: Sources and Definitions

### 3.3 Inclusion

#### 3.3.1 E-Participation

##### E-Participation Index | 2020

The E-Participation Index assesses on a 0-to-1 (best) scale the quality, relevance, and usefulness of government websites. Usefulness refers to a website's ability to provide online information and participatory tools and services to citizens. Countries are benchmarked in three areas within the E-Participation Index: e-information, e-consultation, and e-decision-making. As such, the index indicates both the capacity and the willingness of the state to promote citizen participation in deliberative decision-making in public policy. It also indicates the reach of the state's own socially inclusive governance program.

Source: United Nations Department of Economic and Social Affairs (UNDESA). UN E-Government Knowledgebase. <https://publicadministration.un.org/egovkb/en-us/>

#### 3.3.2 Socioeconomic gap in use of digital payments

Difference between rich and poor income groups that made or received digital payments in the past year (% age 15+) | 2017

The following indicator refers to the share of the poorest 40% and the richest 60% income groups in a country that made or received digital payment within the past 12 months. Made digital payments include the use of "mobile money, a debit or credit card, or a mobile phone to make a payment from an account, or report using the internet to pay bills or to buy something online." Received digital payments include receiving money "directly from or into a financial institution account or through a mobile money account." Final scores express the ratio of the share related to the poorest 40% over the share related to the richest 60%.

Source: World Bank, "Global Findex Database." The World Bank. <https://globalfindex.worldbank.org/>

#### 3.3.3 Availability of local online content

Average answer to the question: "In your country, to what extent are Internet content and services tailored to the local population (e.g. in the local language, meeting local demand)?" (1 = Not at all; 7 = To a great extent] | 2018-19

The annual World Economic Forum's Executive Opinion Survey (EOS) gathers information from business leaders on topics with scarce or non-existent data. It is part of the effort to supplement The Global Competitiveness Report in assessing issues that drive national competitiveness.

Source: World Economic Forum. "Executive Opinion Survey 2018-2019." <http://reports.weforum.org>

#### 3.3.4 Gender gap in Internet use

Difference between female and male population in using the Internet | 2020

The Gender gap in Internet use indicator refers to the share of women and men in a country that use the Internet. Scores are calculated as the ratio of the share related to the female population over the share related to the male population.

Source: International Telecommunication Union (ITU). "ITU World Telecommunication/ICT Indicators database 2021." July 2021. <http://www.itu.int/en/ITU-D/Statistics/Pages/publications/wtid.aspx>

#### 3.3.5 Rural gap in use of digital payments

Difference between the rural population and the total population that made or received

## Appendix II: Sources and Definitions

digital payments in the past year (% age 15+) | 2017

The following indicator refers to the share of the rural population against a country's total population that made or received digital payments within the past 12 months. Made digital payments include the use of "mobile money, a debit or credit card, or a mobile

phone to make a payment from an account, or report using the internet to pay bills or to buy something online." Received digital payments include receiving money "directly from or into a financial institution account or through a mobile money account." Final scores express as a ratio the share related to the rural population over the share related to the total population.

Source: World Bank, "Global Findex Database." The World Bank. <https://globalfindex.worldbank.org/>

### 4th pillar: Impact

#### 4.1 Economy

4.1.1 High-tech and medium-high-tech manufacturing

High-tech and medium-high-tech manufacturing (% of total manufacturing output) | 2018

The following indicator measures high-technology and medium-high-technology output as a percentage of total manufacturing output. Scores are based on the OECD classification of Technology Intensity Definition, itself based on International Standard Industrial Classification (ISIC) Revision 4 and ISIC Revision 3, in addition to data from the INDSTAT 2 database of the United Nations Industrial Development Organization (UNIDO).

Source: United Nations Industrial Development Organization (UNIDO). Directorate for Science, Technology and Industry, Economic Analysis and Statistics Division, "ISIC Rev. 3 Technology Intensity Definition: Classification of Manufacturing Industries into Categories Based on R&D Intensities." Industrial Statistics Database INDSTAT 2, 2020. OECD. <https://stat.unido.org>; [www.oecd.org/sti/ind/48350231.pdf](http://www.oecd.org/sti/ind/48350231.pdf)

4.1.2 High-tech exports

High technology manufactures exports (% of total exports of manufactured goods) | 2019

High-value exports refer to high-technology manufactures (electronic, electrical, and other) calculated according to the Lall classification as an export percentage of all manufactured goods.

Source: World Bank. "World Development Indicators". The World Bank. <http://data.worldbank.org/data-catalog/world-development-indicators>

The classification of exports is based on Lall, S. (2000), The Technological Structure and Performance of Developing Country Manufactured Exports, Oxford Development Studies, 28(3), 1985-1989

4.1.3 PCT patent applications

Number of applications filed under the Patent Cooperation Treaty (PCT) (per million population) | 2020

A PCT application refers to an international patent application filed through the WIPO-administered Patent Cooperation Treaty

## Appendix II: Sources and Definitions

(PCT). The PCT system makes it possible to seek simultaneous patent protection for an invention in several countries by filing a single international patent application. The residence of the first-named applicant determines the origin of the PCT application. Data are available only for those economies which are PCT Contracting States (153 to date). Data are scaled by Purchasing Power Parity (PPP\$) GDP and shown in billions.

Source: World Intellectual Property Organization. “Intellectual Property Statistics.” International Monetary Fund, World Economic Outlook Database, October 2020. [www.wipo.int/ipstats](http://www.wipo.int/ipstats); <https://www.imf.org/en/Publications/SPROLLS/world-economic-outlook-databases>

### 4.1.4 Growth rate of GDP per person engaged

Growth rate of GDP per person engaged (% three-year average) | 2019

The following indicator refers to the growth rate of real GDP per person employed averaged over the three most recent and available years (2018, 2019, 2020). Growth of GDP per person engaged provides a measure of labor productivity (defined as output per unit of labor input). GDP per person employed is expressed as a percentage of total employment in the economy.

Source: The Conference Board. “Total Economy Database™ Output, Labor and Labor Productivity, 1950–2020 - Key Findings.” April 2021 preliminary release. <https://www.conference-board.org/data/economydatabase>

### 4.1.5 Prevalence of gig economy

Average answer to the question: “In your country, to what extent is the online gig economy prevalent?” [1 = Not at all; 7 = To a great extent] | 2018–19

The annual World Economic Forum’s Executive Opinion Survey (EOS) gathers information from business leaders on topics with scarce or non-existent data. It is part of the effort to supplement The Global Competitiveness Report in assessing issues that drive national competitiveness. The gig economy refers to a labor market specific to digital platforms and work arrangements focused on short-term contracts and task-based work.

Source: World Economic Forum. “Executive Opinion Survey 2018–2019.” <http://reports.weforum.org>

### 4.1.6 ICT services exports

Telecommunications, computers, and information services exports (% of total trade) | 2019

The ICT services exports indicator defines telecommunications, computer, and information services as a percentage of total trade. Values are given according to the Extended Balance of Payments Services Classification EBOPS 2010, coded SI: Telecommunications, computer, and information services.

Source: World Trade Organization. “Trade in Commercial Services database.” 2019. Values based on the classification of the sixth (2009) edition of the International Monetary Fund’s Balance of Payments and International Investment Position Manual and Balance of Payments database, 2019. <https://www.imf.org/external/pubs/ft/bop/2007/pdf/bpm6.pdf>; [www.oecd.org/std/its/EBOPS-2010.pdf](http://www.oecd.org/std/its/EBOPS-2010.pdf).

## 4.2 Quality of Life

### 4.2.1 Happiness

Happiness score (life ladder) | 2019

Happiness refers to the national average

## Appendix II: Sources and Definitions

response to the following survey question included in the Gallup World Poll: “Please imagine a ladder, with steps numbered from 0 at the bottom to 10 at the top. The top of the ladder represents the best possible life for you and the bottom of the ladder represents the worst possible life for you. On which step of the ladder would you say you personally feel you stand at this time?” The indicator is also known as the Cantril life ladder, life ladder, or subjective well-being.

Source: The Gallup World Poll (2005–2019) (<https://www.gallup.com/analytics/232838/world-poll.aspx>), sourced from Helliwell, John F., Richard Layard, Jeffrey Sachs, and Jan-Emmanuel De Neve. “World Happiness Report 2020.” New York: Sustainable Development Solutions Network, 2020. <https://worldhappiness.report/>

### 4.2.2 Freedom to make life choices

Freedom to make life choices score | 2019

Freedom to make life choices refers to the national average response to the following survey question included in the Gallup World Poll: “Are you satisfied or dissatisfied with your freedom to choose what you do with your life?”

Source: The Gallup World Poll (2005–2019) (<https://www.gallup.com/analytics/232838/world-poll.aspx>), sourced from Helliwell, John F., Richard Layard, Jeffrey Sachs, and Jan-Emmanuel De Neve. “World Happiness Report 2020.” New York: Sustainable Development Solutions Network, 2020. <https://worldhappiness.report/>

### 4.2.3 Income inequality

Gini index | 2018

The Gini index is a measure of income inequality within an individual economy. At a technical level, it is based on a Lorenz curve

that “plots the cumulative percentages of total income received against the cumulative number of recipients.” The Gini index also refers to the area between the Lorenz curve and the (hypothetical) line of perfect equality. The scale of the Gini index ranges from 0 (perfect equality) to 100 (perfect inequality).

Source: World Bank, “World Development Indicators.” The World Bank. <http://data.worldbank.org/data-catalog/world-development-indicators>

### 4.2.4 Healthy life expectancy at birth

Healthy life expectancy at birth (years) | 2016

The Healthy life expectancy at birth indicator expresses the “average number of years that a person can expect to live in ‘full health’ by taking into account years lived in less than full health due to disease and/or injury.” The number of years lost due to ill health in a country is estimated by the disability rate per capita (adjusted for independent comorbidity) broken down by age and sex.

Source: World Health Organization. “Global Health Observatory (GHO) database.” <https://www.who.int/data/gho>

## 4.3 SDG Contribution

### 4.3.1 SDG 3: Good Health and Well-Being

Universal health coverage | 2017

The following indicator refers to the Universal health coverage (UHC) service coverage index and is one of the official indicators related to SDG 3: Ensure healthy lives and promote well-being for all at all ages (indicator 3.8.1). The UHC service coverage index encompasses essential health services that include reproductive, maternal, newborn and child health, infectious diseases, service capacity and access, and non-communicable diseases among the general and the most

## Appendix II: Sources and Definitions

disadvantaged population. Scores report on a scale of 0–100 and compute the geometric mean of 14 tracer indicators related to health service coverage. The tracer indicators on service coverage compile into four components: (1) Reproductive, maternal, newborn and child health, (2) Infectious diseases, (3) Noncommunicable diseases (4) Service capacity and access.

Source: World Health Organization. “Tracking universal health coverage: 2019 Global Monitoring Report”. Geneva, WHO, 2019. (<https://www.who.int/data/monitoring-universal-health-coverage>). Taken from United Nations, Open SDG Data Hub (<http://www.sdg.org>)

### 4.3.2 SDG 4: Quality Education

PISA average scores in reading, mathematics, and science | 2018

The SDG 4: Quality Education indicator captures data from triennial surveys provided by the OECD’s Programme for International Student Assessment (PISA) that examine 15-year-old students’ performance in reading, mathematics, and science. Score calculations involve a mean of 500 and a standard deviation of 100. The scores for China come from Beijing-Shanghai-Jiangsu-Guangdong.

Source: OECD. “Programme for International Student Assessment (PISA).” [www.oecd.org/pisa](http://www.oecd.org/pisa)

### 4.3.3 Females employed with advanced degrees

Females employed with advanced degrees, % total employed (25+ years old) | 2019

The following indicator refers to the percentage of females employed with advanced degrees out of the total employed population. Employed persons comprise all of working age who during a specified period

engaged in one of the following categories: (1) paid employment; or (2) self-employment. Data are disaggregated by level of education and refers to the highest level of education completed as classified by the International Standard Classification of Education (ISCE). Data for Canada sources Table 14-10-0020-01 of the Labour Force Survey.

Source: International Labour Organization. “ILOSTAT Database of Labour Statistics; Statistics Canada.” Table 14-10-0020-01 Unemployment rate, participation rate, and employment rate by educational attainment, annual, accessed February 10, 2020 (2011–20). ([www.ilo.org/ilostat](http://www.ilo.org/ilostat); <https://www150.statcan.gc.ca/t1/tbl1/en/tv.action?pid=1410002001>).

### 4.3.4 SDG 7: Affordable and Clean Energy

Energy intensity | 2016

The Affordable and Clean Energy indicator refers to the energy intensity level of primary energy (defined in megajoules per constant 2011 purchasing power parity GDP) and is an official indicator related to SDG 7: Ensure access to affordable, reliable, sustainable, and modern energy for all (indicator 7.3.1).

Source: Energy Balances, UN Statistics Division (2018) and IEA (2018), World Energy Balances. Sourced from United Nations, Open SDG Data Hub. <http://www.sdg.org>

### 4.3.5 SDG 11: Sustainable Cities and Communities

Urban safety and sustainability | 2016

Two indicators capture the safety and sustainability of cities: urban pollution and road safety. Urban pollution officially relates to SDG 11: Make cities and human settlements inclusive, safe, resilient, and sustainable (indicator 11.6.2) and is measured by the annual mean concentration of fine particulate matter in urban areas less than 2.5 microns in diameter.

## Appendix II: Sources and Definitions

Road safety refers to the death rate due to road traffic injuries per 100,000 population. It is an official indicator related to SDG 3: Ensure healthy lives and promote well-being for all at all ages (indicator 3.6.1), and is also associated with SDG Target 11.2: By 2030, provide access to safe, affordable, accessible, and sustainable transport systems for all, improving road safety, notably by expanding public transport, with special attention to

the needs of those in vulnerable situations, women, children, persons with disabilities and older persons. The data refers to the simple mean of the reversed normalized scores of the two indicators.

# Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

# Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

**Giulio Caperna and Pablo de Pedraza**

European Commission  
Joint Research Centre

## 1. Introduction

The redesigned Network Readiness Index 2021 (NRI 2021) aims to reflect ICT deployment issues better than the NRI 2016 and NRI 2020 without losing continuity with previous exercises. It has evolved from NRI 2020. This evolution also includes new indicators that contribute to the goal of being future proof in capturing the integration of people and technology, its governance, and its economic impact. The challenges of the emerging information society and economy and the increasing importance of technology, artificial intelligence and data motivates the NRI and its goals.

NRI 2021 overall structure remains stable with respect to NRI 2020. It is composed of four pillars: Technology, People, Governance, and Impact. Technology seeks to assess the level of technology in a given country; People is concerned with the application of ICT by individuals, businesses, and governments; Governance assesses the national environment in terms of trust, regulation, and inclusion; and Impact tries to capture the economic, social, and human impact of participation in the network economy. Each pillar has the same weight in the computation of the index. All pillars are composed of three sub-pillars that are weighted equally. The number of indicators making up each sub-pillars varies. They are equally weighted in each sub-pillar, therefore the weight of each individual indicator in the overall index varies.

NRI 2021 is timely in tackling how technology benefits the general population and the

economy and, in its approach, highlighting the importance of regulations, economic benefits, well-being and the achievement of SDGs. The NRI 2021 framework is well constructed, and a lot of thought has clearly been put into it. However, conceptual, and practical challenges are inevitable when trying to summarize with a single composite indicator the complexity of the emerging economic order within the information society, its regulation and its economic impact. Challenges are even more complicated when considering the changing nature of Technology and NRI's future-proof ambitions.

The European Commission's Competence Centre on Composite Indicators and Scoreboards at the Joint Research Centre (JRC) has performed this audit upon the invitation of the developers. The analysis herein aims at shedding light on the consistency, transparency, and reliability of the NRI 2021 and thus enabling policymakers to derive accurate, meaningful and consistent conclusions. The JRC assessment of the NRI 2021 presented here focuses on two main issues: the statistical coherence of the structure, and the impact of key modelling assumptions. The statistical analysis is based on the adequacy of aggregating indicators into pillars, and pillars into the overall index. Finally, the JRC analysis complements the reported country rankings for the NRI index 2021 with simulated intervals, in order to better appreciate the robustness of these ranks to the modelling choices.

TABLE A-II.1: CONCEPTUAL FRAMEWORK OF THE NRI 2021

Pillar	Sub-pillar	ID	Variable Name	Note
1. TECHNOLOGY	1.1 Access	1.1.1	Mobile tariffs	
		1.1.2	Handset prices	
		1.1.3	Households with internet access	
		1.1.4	SMS sent by population 15-69	Replaces 4G mob. net. coverage
		1.1.5	Population covered by at least a 3G mobile network	
		1.1.6	International Internet bandwidth	
		1.1.7	Internet access in schools	
	1.2 Content	1.2.1	GitHub commits	
		1.2.2	Wikipedia edits	
		1.2.3	Internet domain registrations	
		1.2.4	Mobile apps development	
		1.2.5	AI scientific publications	New Indicator
	1.3 Future Technologies	1.3.1	Adoption of emerging technologies	
		1.3.2	Investment in emerging technologies	
		1.3.3	Robot density	
		1.3.4	Computer software spending	
2. PEOPLE	2.1 Individuals	2.1.1	Active mobile broadband subscriptions	Replaces Internet users
		2.1.2	ICT skills	
		2.1.3	Use of virtual social networks	
		2.1.4	Tertiary enrollment	
		2.1.5	Adult literacy rate	
	2.2 Businesses	2.2.1	Firms with website	
		2.2.2	GERD financed by business enterprise	Replaces Ease of Doing Business
		2.2.3	Professionals	
		2.2.4	Technicians and associate professionals	
		2.2.5	Annual investment in telecommunication services	Replaces Business use digit tools
		2.2.6	GERD performed by business enterprise	Replaces R&D Expend. businesses
	2.3 Governments	2.3.1	Government online services	
		2.3.2	Publication and use of open data	
		2.3.3	Gov. promotion of investment in emerging technologies	
		2.3.4	R&D expenditure by governments and higher education	
3. GOVERNANCE	3.1 Trust	3.1.1	Secure Internet servers	
		3.1.2	Cybersecurity	
		3.1.3	Online access to financial account	
		3.1.4	Internet shopping	
	3.2 Regulation	3.2.1	Regulatory quality	
		3.2.2	ICT regulatory environment	
		3.2.3	Legal framework's adaptability to emerging technologies	
		3.2.4	E-commerce legislation	
		3.2.5	Privacy protection by law content	
	3.3 Inclusion	3.3.1	E-Participation	
		3.3.2	Socioeconomic gap in use of digital payments	
		3.3.3	Availability of local online content	
		3.3.4	Gender gap in Internet use	
		3.3.5	Rural gap in use of digital payments	
4. IMPACT	4.1 Economy	4.1.1	High-tech and medium-high-tech manufacturing	Revised Methodology
		4.1.2	High-tech exports	Revised Methodology
		4.1.3	PCT patent applications	
		4.1.4	Growth rate of GDP per person engaged	Revised Methodology
		4.1.5	Prevalence of gig economy	
		4.1.6	ICT services exports	New Indicator
	4.2 Quality of Life	4.2.1	Happiness	
		4.2.2	Freedom to make life choices	
		4.2.3	Income inequality	
		4.2.4	Healthy life expectancy at birth	
	4.3 SDG Contribution	4.3.1	SDG 3: Good Health and Well-Being	
		4.3.2	SDG 4: Quality Education	
		4.3.3	Females employed with advanced degrees	Replaces SDG 5
		4.3.4	SDG 7: Affordable and Clean Energy	
		4.3.5	SDG 11: Sustainable Cities and Communities

# Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

## 2. Conceptual framework

The structure of the NRI is summarized in Table 1. Developers selected variables based on relevance to a specific pillar, literature review, expert opinion, country coverage. In NRI 2021 a total of 13 indicators have changed. Some faced a methodological change, some have been dropped from the framework, and some have been newly introduced. The last column of Table 1 gives a brief idea of what is changed and how.

In view of further evolution of the index, the developers may consider further exploration of the Network economy specific measures, which would make the framework more consistent with the changing nature of technology and foster even more the NRI's goal of being future proof. Many aspects of the digital economy and its conceptualization, its economic benefits, drawbacks and consequent governance are still under discussion and beyond current state of knowledge. This has always made NRI future-proof goal difficult to conceptualize and audit. Some notable conceptualization efforts are being done from social scientists and developers may consider them in future editions. In addition to the reference suggested in the previous audit, we suggest a further reference on conceptualizing specific aspects of the digital economy (Pedraza and Vollbracht 2020).

## 3. Data quality and availability

Regarding data coverage, the general practice is to establish a threshold above which an indicator is excluded from the framework. For the NRI development, the inclusion of countries and indicators is based on the double threshold approach. In terms of country coverage, this means that only countries with data available for at least 70% of all indicators are included in the NRI. In addition, countries need to

pass a sub-pillar level data availability of at least 40%. In terms of indicator coverage, only indicators with availability of at least 50% of countries are included in the NRI. Despite the absence of an absolute golden standard, the JRC-team suggests to include only indicators with a maximum one-third of missing values (33%). When an indicator represents a very specific and central concept, also a looser threshold of 40% missing countries could be integrated in the structure.

According to this principle, the following indicators should be taken under observation (percentage of missing values in parenthesis): 1.1.6 International Internet (33.8%), 1.1.7 internet access in the schools (44.6%), 1.3.3. Robot density (56.9%), 2.1.2. ICT skills (44.6%), 4.3.2. SDG4 Quality education (40.8%). These indicators could be the focus of future refinement, with the aim of improving their coverage or excluding/modifying them.

The presence of outliers, which could potentially bias the effect of the indicators on the aggregates, was properly identified by developers: when the variables have simultaneously absolute skewness greater than 2.0 and kurtosis greater than 3.5 the indicator was treated. Developers report treatment of fourteen indicators. They treated them differently depending on the number of extreme values. Five indicators were winsorized via eliminating the value affecting the distribution and assigning to it the next highest/lowest value method. The process continues until the reported skewness and/or kurtosis fall within the ranges specified above. Nine indicators, with a high number of extreme values (more than five) were transformed using the logarithmic formula. From the analysis of the JRC-COIN there are four indicators (1.1.4, 1.1.5, 2.1.1, 2.2.5) that still report skewness and/or kurtosis beyond the above threshold. All of them show negative skewness, meaning that the outliers are

## Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

low outliers. It happens when the country with the minimum value has a value largely below the others. It is the case of all four variables.

In particular, variables 1.1.4 and 2.1.1 are the result of an extensive measure, meaning that they depend on the concept they are representing and the dimension of the countries. The developers are aware that these elements could carry information on population dimension together with the specific meaning, but it is their primary intention to not lose a point of view on the dimension of the penetration of the specific communication systems. The denomination by – for instance – the population, would shrink the concept to a rate, while the developers are trying to assess the actual magnitude of the system. In order to understand the impact of the two extensive variables, the JRC-COIN team performed a sensitivity analysis comparing the official NRI ranks and the ranks that would result from the exclusion of the two variables. The difference between the two models does not seem to be particularly large and is presented in Section 5.

The JRC-COIN suggests taking the four variables underlined in the last two paragraphs as good candidates for further refinement in future editions.

Some indicators are constituted by other composite indicators and scores, whose composition, methodology and statistical coherence are not audited here. As a general suggestion, the JRC-COIN proposes to keep the amount of complex values to a minimum so the inexperienced reader can grasp the meaning of indicators by their names and the risk of overlaps is reduced to the minimum. In the NRI, most of the composite indicators are grouped in the Impact pillar, easing the interpretation of their role in the index.

### 4. Normalisation

The indicators are rescaled to a 0–100 scale using the MIN-MAX formula, with 0 as the lowest score achieved by countries, and 100 as the highest, which is a common and usually desired practice in the composite indicators' construction. The normalisation formula is selected in order to obtain higher scores representing better outcomes. The direction of some indicators may not be extremely intuitive for a non-expert reader, we suggest reconsidering the naming of some of the variables or be sure to supply clear explanations in the report. Further analysis of this aspect could be found in the previous audit and is not included for space reasons (note 1).

### 5. Statistical coherence

The statistical coherence is based on a multi-level analysis of the correlations among indicators and of indicators and aggregates, and a comparison of the index's rankings with the ranks defined by the pillars.

#### 5.1 Correlation analysis

The statistical coherence of an index should be considered a necessary but not a sufficient condition for a sound index. Given that the statistical coherence is mostly based on correlations, the correspondence of each composite indicator to a real world phenomenon needs to be critically addressed because “correlations do not necessarily represent the real influence of the individual indicators on the phenomenon being measured” (OECD & JRC, 2008). This relies on the interplay between both conceptual and statistical soundness. The degree of coherence between the conceptual framework and the statistical structure of the data is an important factor for the reliability of an index, among other things.

## Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

The correlation analysis is used to address to what extent the data support the conceptual framework. In the ideal case, there should be positive correlations within every level of the index. This effectively ensures that the overall index scores adequately reflect the underlying indicator values. On the one hand, not significant correlations should be avoided, as they indicate lack of contribution of a specific indicator to a higher aggregation level. On the other hand, redundancy, too high correlations, should also be avoided. If two indicators are collinear, this may amount to double counting (and therefore over-weighting) the same phenomenon making the aggregation redundant. JRC team normally set two thresholds: 0.3, after which two indicators are conspired to share a meaningful amount of their information and can be aggregated or that an indicator is contributing to its higher aggregation level; and 0.92 after which two indicators should be considered with care since they may represent very similar concepts, and at risk of double counting. When this high level of correlation is observed between an indicator and an aggregate, it is possible that the indicator is dominating the higher aggregation level especially if the other elements of the group have largely lower correlation.

### 5.1.1 Correlation analysis between indicators and aggregates

The exploration of correlations among indicators in the same sub-pillar shows that most of the sub-pillars are statistically consistent, many correlations are above 0.33 and below 0.93, negative correlations are rare and none of them is below -0.33. The NRI is therefore, in general, statistically coherent at the indicator level. There are some exceptions to this general rule.

For example, indicator 1.1.4 SMS sent by population 15-69, has very low correlation (below 0.33) with most of the indicators in his

sub-pillar and pillar. Exploring the correlations of 1.1.4 with the rest of the framework, we observe the same pattern. This is probably due to the extensive nature of the variable used, which is not computed per-capita, and hence the information it carries is related to the population dimension. The same can be observed for variable 2.1.1 Active mobile broadband subscriptions (count).

There are two indicators in pillar 4 in a similar situation. On the one hand, indicator 4.1.4 Growth rate of GDP per person engaged is not correlated with other indicators measuring the impact of technology. Probably developed economies, with lower GDP growth rates, are those that register patents, manufacture and export technology (4.1.1, 4.1.2, 4.1.3). A solution might be to use GDP level rather than growth rate. On the other hand, 4.3.4. SDG 7: Affordable and Clean Energy SDG 7 is also not correlated with other indicators of pillar 4, and only slightly correlated with the sub-pillar and pillar.

Correlations of indicators with pillars and overall index are in general very high (Table 2). There are few indicators whose association with their pillar is below the threshold (0.33). They are the same listed in the previous paragraph, namely 1.1.4. SMS sent by population 15-69 in pillar 1, 2.1.1. Active mobile broadband subscriptions in pillar 2, and 4.1.4. Growth rate of GDP per person engaged and 4.3.4. SDG 7: Affordable and Clean Energy in pillar 4. These indicators seem also under-represented in the overall index.

Few indicators display very high correlation with their pillars. The correlations of one indicator, 1.3.1. Adoption of emerging technologies, with its sub-pillar, 1.3 future of technology, is beyond the threshold. There are no other indicators displaying correlations with their sub pillars, pillars and the index beyond the threshold. Although seven indicators are close to the threshold, their correlation with the overall index is between 0.90 and 0.92.

**TABLE A-II.2: CORRELATIONS BETWEEN INDICATORS, PILLARS AND OVERALL INDEX**

		p.01	p.02	p.03	p.04	NRI
1. Technology	1.1.1. Mobile tariffs	0.84	0.83	0.81	0.81	0.85

	4.3.5. SDG 11: Sustainable Cities and Communities		0.73	0.70	0.71	0.79	0.75

Numbers represent the Pearson correlation coefficients. Good correlations (i.e. Pearson correlation coefficients greater than 0.30 and lower than 0.92) are written in black. Correlations with low values (between -0.30 and 0.30) are written in grey. Correlations at risk of redundancy (here >0.91) are written in red. There are no correlations with meaningful negative value (i.e. <-0.30). Source: Elaborated by European Commission's Joint Research Centre, 2020.

### 5.1.2 Correlation analysis between sub-pillars, pillars and index

The values in Table 3 represent the correlation between the aggregates. This level is the most important as it represents the consistency of the general concepts. All pillars appear consistent, with the sub-pillars being well correlated with each other. Correlations between sub-pillars and pillars and the index show again that the NRI has a strong correlation structure being too high correlations (written in red) the main concern. It is important to notice how a correlation of 0.92, corresponds to the possibility of explaining 85% of the variance of one variable using the other.

In the case of the NRI, some sub-pillars tend to be extremely correlated with their pillar. That is the case of sub-pillars 1.1 Access and 1.2 Content and pillar 1 (0.94), sub-pillars 3.1 Trust and 3.3 Inclusion and pillar 3 (0.97 and 0.94 respectively). However, also the other sub-pillars and pillars have a high correlation. Considering this, there are no sub-pillars dominating their groups, but still there is a large room for simplification.

The highest aggregation step, between pillars and from pillars to NRI, also displays very high correlations, all above 0.9. High statistical reliability among the main

components can be the result of redundancy of information. Overall, NRI indicators, pillars and sub-pillars seem to be measuring similar phenomena. The exclusion of some elements from the framework will probably have a small effect on the final result. Keeping in mind the importance of parsimony, the reduction in the number of indicators could be an interesting option that the JRC-COIN suggests for future editions.

In Figure 1 the relation between pillars and the index is visualised. The structure of the NRI Index allows for a dual narrative. On the one hand, it's a strong index in terms of statistical consistency that shows that ICT deployment is a multifaceted phenomenon where technology, users and several aspects of ICT regulation go hand in hand, especially in developed economies with high quality of life. On the other hand, taking into account several generally accepted problems of ICT deployment, the picture may reflect the repetition of some concepts and even double counting of them. Possible suggestions for the future may be also centred on the exploration of new indicators capturing vaster and more specific aspects of ICT deployment. For instance, Artificial intelligence transparency, data portability, data sharing, data markets, and antitrust concerns digital economy paradoxes.

## Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

### 5.2 Added value of the Network Readiness Index

The high statistical reliability and coherence of an Index may sometimes determine a partial overlap among the concepts represented in the pillars. For 19% to 28% of the countries included in the index, the NRI ranking and the pillar's rankings differ by 10 positions or more (see Table 4). This suggests that the NRI ranking highlights aspects of countries'

network readiness that do not emerge by looking into the four pillars separately, but only for a minority of countries. This result suggests a strong concordance among the aggregates, and implies the presence of room for simplification. In such a situation, the developers may consider excluding some elements of the index, and hence improve readability, without jeopardising the integrity of the pillars and overall Index.

**TABLE A-II.4. DISTRIBUTION OF DIFFERENCES BETWEEN PILLARS AND NRI RANKINGS**

Shift respect to NRI	Technology	People	Governance	Impact
More than 30 positions	0.0%	1.5%	0.0%	3.1%
11 to 30 positions	19.2%	20.8%	23.8%	25.4%
More than 10 positions	19.2%	22.3%	23.8%	28.5%
6 to 10 positions	26.2%	30.0%	18.5%	20.8%
Up to 5 positions	50.0%	36.2%	55.4%	40.8%
0 positions	4.6%	11.5%	2.3%	10.0%

### 6. Impact of modelling assumptions on the NRI results

A fundamental step in the statistical analysis of a composite indicator is to assess the effect of different modelling assumptions on the scores and country rankings. Despite the efforts at the development process, there is an unavoidable subjectivity (or uncertainty) in the resulting choices. This subjectivity can be explored by comparing the results obtained under different – alternative – assumptions.

The literature on this topic suggests to assess the robustness of the index by means of a Monte Carlo simulation and by applying a multi-modelling approach, assuming ‘error free’ data as eventual errors have already been corrected in the preliminary stage of the index construction (Saisana, D’Hombres, Saltelli 2011).

The NRI 2021, as most composite indicators, is the outcome of several choices concerning, among other things, the underlying theoretical framework, the indicators selected, the normalisation method, the weights assigned, and the aggregation method. Some of these choices may be based on expert opinion or other considerations, driven by statistical analysis or by the need to ease communication and draw attention to specific issues.

This section aims to test the impact of varying some of these assumptions within a range of plausible alternatives in an uncertainty analysis. The objective is therefore to try to quantify the uncertainty in the ranks of the NRI 2021, which can demonstrate the extent to which countries can be differentiated by their scores.

The modelling issues considered in the robustness assessment of the NRI 2021 are the aggregation formula and pillars’ weights (note 2).

**Aggregation formula.** The NRI team opted for the arithmetic averaging of the four pillars, which implies a strong compensability allowing for an outstanding performance in some aspects to balance the weaknesses in others and vice-versa. This approach puts at the same level countries with both high and low results with more “balanced” countries showing average results. To assess the impact of this choice, the JRC included in the analysis a comparison with the geometric mean. The comparison of the two aggregation approaches should be able to highlight countries with unbalanced profiles, since the geometric mean tends to penalize low values, especially in the presence of other values that are not so low (unbalanced profiles).

**Weights.** The simulation comprised 1,000 runs of different set of weights for the pillars constituting the Index. In the 1,000 runs, the weights are the result of a random extraction based on uniform continuous distributions centred in the reference value (1/4) plus or minus 20% of this value. All simulated 1,000 runs are then used in all the scenarios determined by the other assumptions.

As summarised in Table 5, four models were tested comparing the different aggregation formulas, the different imputation methods and applying the 1,000 runs of different sets of weights resulting in a total of 2,000 runs of simulations.

## Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

**TABLE A-II.5. ALTERNATIVE ASSUMPTIONS CONSIDERED IN THE ANALYSIS**

	Reference	Alternative
<b>I. Aggregation formula</b>	Arithmetic average	Geometric average
<b>II. Weighting system</b>	Equal weights	Varying
Technology	0,25	U [ 0.2; 0.3 ]
People	0,25	U [ 0.2; 0.3 ]
Governance	0,25	U [ 0.2; 0.3 ]
Impact	0,25	U [ 0.2; 0.3 ]

The main results obtained from the robustness analysis are shown in Figure 2, with median ranks and 90% intervals computed across the 2,000 Monte Carlo simulations. Countries are ordered from best to worst according to their NRI rank where the blue dots represent the median rank among the simulations. For each country, the error bars represent the 90% interval across all simulations, that is, from the 5th to the 95th percentile of the countries' rank among all the simulations.

NRI ranks are shown to be representative of a plurality of scenarios and extremely robust to changes in the assumptions. Considering the median rank across the simulated scenarios, as being representative of these scenarios, then the fact that the NRI rank is close to the median rank (less than three positions away) for 100% of the countries suggests that NRI is a suitable and stable summary measure. Furthermore, the majority of the countries' ranks hardly vary across simulations (less than 5 positions for all countries but four).

These results imply that the NRI ranks are robust to changes in the pillars' weights and aggregation formula.

Only the Dominican Republic, Jamaica, Oman and Peru are showing a simulated interval larger than 5 positions but still smaller than 10. This result is a direct effect of the correlation structure among pillars and Index. It makes the NRI ranks very stable for all countries.

Overall, country ranks in NRI are highly robust to changes for all the countries considered, enough to allow for meaningful inferences to be drawn. For full transparency and information, Table 6 reports the NRI country ranks together with the simulated intervals (central 90 percentiles observed among the 2,000 scenarios) in order to better appreciate the robustness of these ranks to the computation methodology, and to ease the analysis of the behaviour of specific countries respect to perturbations.

## Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

**FIGURE A-II.3:** SENSITIVITY ANALYSIS: COMPARISON OF RANKS ACCORDING TO ARITHMETIC AND GEOMETRIC MEAN.

Source: European Commission, Joint Research Centre, 2021.

Note: countries are labelled when they show a shift of at least 5 positions between the two aggregation formulas.

## Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

Figure A-II.4 compares NRI ranks with ranks obtained excluding the two indicators highlighted in Section 3 (1.1.4 and 2.1.1) which show poor correlations due to their definition, partially dependent on the population

dimension. The differences among the two rankings are not significantly large. No country shows a difference of ranks above the five positions. This result shows how small is the effect of the two indicators

**FIGURE A-II.4: SENSITIVITY ANALYSIS: RANKS COMPARISON NRI VS NRI WITHOUT 1.1.4 AND 2.1.1.**

Source: European Commission, Joint Research Centre, 2021.

Note: countries are labelled when they show a shift of at least 5 positions between the two treatments of missing data.

## Appendix III: JRC Statistical Audit of the 2021 Network Readiness Index

The uncertainty analysis and sensitivity analysis portray the NRI as a deeply stable index. This result allows for inference on the ranks and suggests also the presence of similar concepts across the pillars. Thanks to the correlation structure of the index, the developers could consider simplifying the framework excluding some indicators, often described by the other indicators of the same sub-pillars and pillars, without any worries about the coherence of the index.

### 7. Conclusions

The JRC statistical audit delves into the extensive work carried out by the developers of the NRI 2021 to suggest improvements in terms of data characteristics, structure and methods used. The analysis aims to ensure the transparency of the index methodology and the reliability of the results.

The NRI 2021 is a strong index in terms of conceptual and statistical consistency. It shows that ICT deployment is a multifaceted phenomenon where technology, users and several aspects of ICT regulation go hand in hand. The data coverage of the framework is good. Most indicators contain no or very few missing values. Some indicators, 5 out of 60, may be candidates for special attention as their percentage of missing values is above what is usually recommended.

Developers decided not to impute them. It is a common practice in composite indicators construction.

The index is statistically well balanced with respect to its indicators, sub-pillars and pillars. Correlations between each pillar and the respective sub-pillar are mostly significant and positive. Most of the indicators are meaningfully correlated with the index and relative pillars. The possible presence of redundancy is the only concern in the analysis of the NRI structure. The suggestion is to use the index's very stable and correlated structure to explore and open to the simplification of the framework or to some even more specific aspects of the network economy.

Treatment of outliers conducted by the NRI developers is appropriate. Despite this, four indicators are identified as good candidates for refinement in the audit because of their distribution and/or definition. The exclusion of two of these indicators is tested, verifying their limited effect on the rankings. JRC-COIN analysed a series of different choices that are made during the index construction. The results of the uncertainty analysis reveal that NRI is a robust summary measure in general, the present audit confirms that the NRI 2021 Index is reliable, with a statistically coherent framework and acknowledges the important efforts done by the developers' team.

## Notes

The previous audit is included in the NRI 2020 report.

The analysis of the effect of the imputation of missing data is not included as it was already presented in the audit to the previous edition of the NRI

## About STL

STL is an industry-leading integrator of digital networks. With STL's 25 years of experience in Optical Fibre innovations and India-made secure 5G solutions, we enable full value of connectivity by building end to end technology solutions that make digital networks ready for tomorrow. We design and integrate these digital networks for our customers. With core capabilities in Optical Interconnect, Virtualized Access Solutions, Network

Software and System Integration, we are the industry's leading end-to-end solutions provider for global digital networks. We partner with global telecom companies, cloud companies, citizen networks and large enterprises to deliver solutions for their fixed and wireless networks for current and future needs.

## About Portulans Institute

Co-founded in 2019 by Soumitra Dutta and Bruno Lanvin, the Portulans Institute (PI) is an independent nonprofit, nonpartisan research and educational institute based in Washington DC.

### Our Mission

Portulans Institute's areas of expertise include technology competitiveness, innovation readiness, and people and global talent. Our mission includes:

To develop cross-community knowledge and dialogue on how people, technology, and innovation contribute to sustainable and inclusive growth.

To inform policymakers by producing independent, data-based research.

To collaborate with private sector leaders in driving a business agenda that invests in people, technology and innovation.

To host and co-organize events and conferences on the above issues affecting human-centric sustainable economic prosperity.

### Where our name and logo come from

Portulans (or portolans) are ancient nautical maps, first made in the 13th century in the Mediterranean basin and later expanded to include other regions.

The word portolan comes from the Italian portulano, meaning “related to ports or harbors,” and which since at least the 17th century designates “a collection of sailing directions.” In these maps, only a few harbors were visible, and much of the coastlines were hypothetical.

This is how we see our mission: In an uncertain world, much is yet to be explored, and many opportunities have yet to be identified. Like the navigators of the 16th century, modern leaders have to make decisions on the basis of imperfect information and incomplete maps.

The Portulans Institute aims to provide them with the best available data and analysis, and the directions that they need. This is why our logo combines a compass and pi, which is not only a powerful number found in geometry, algebra, physics, and arts, but also an infinite series of digits, with no pre-written rule telling us what the next one might be.

## The NRI Team

### **Prof. Bruno Lanvin**

Co-editor and Co-author

Bruno Lanvin is Co-Founder of Portulans Institute and INSEAD Distinguished Fellow. He worked for the World Bank, where he was inter alia Senior Advisor for E-strategies, Regional Coordinator (Europe and Central Asia) for ICT and e-government issues, and Chairman of the Bank's e-Thematic Group. Since 2002 he has been co-authoring the Global Information Technology Report (INSEAD-World Economic Forum), now the Network Readiness Index Report (Portulans Institute), and he is currently (and has been since 2007) the co-editor of the Global Innovation Index Report (WIPOPortulans Institute). From June 2001 to December 2003, he was the Manager of the Information for Development Program (infoDev) at the World Bank. In 2000, Dr Lanvin was appointed Executive Secretary of the G8-DOT Force. Until then, he occupied several high-level positions at the United Nations in Geneva and New York, including that of Chief of Cabinet of the Director General. Dr Lanvin holds a BA in Mathematics and Physics from the University of Valenciennes (France), an MBA from Ecole des Hautes Etudes Commerciales (HEC) in Paris, and a PhD in Economics from the University of Paris I (La Sorbonne) in France. He is also an INSEAD alumnus (IDP-C). A frequent speaker at high-level meetings, he advises a number of global companies and governments and has been a member of numerous boards, including those of IDA Infocomm (Singapore), ICANN, GovTech (Singapore), the Mohammed Bin Rashid Center for Government Innovation (United Arab Emirates), IPWatch, and the Association for Accountability and Internet Democracy (AAID).

### **Prof. Soumitra Dutta**

Co-editor and Co-author

Soumitra Dutta is Professor of Management and the former founding dean of the Cornell SC Johnson College of Business. Previously, he was the Anne and Elmer Lindseth Dean of the Samuel Curtis Johnson Graduate School of Management. Prior to joining Cornell in 2012, he was on the faculty and leadership team of INSEAD. Mr. Dutta is an authority on technology and innovation policy, and has engaged in a number of multi-stakeholder initiatives to shape global, regional, and industry agendas. He is the

co-editor and author of The Global Information Technology Report, published by the World Economic Forum, and The Global Innovation Index, published by the World Intellectual Property Organization.

Mr. Dutta is on the global boards of Sodexo and Dassault Systèmes, and is a member of the Shareholder Council of Chicago-based ZS Associates. He serves on the advisory boards of several business schools, including HEC, Montreal; ESADE, Barcelona; and ESCP, Paris. He has co-founded two firms, including Fisheye Analytics, which WPP group acquired. He is currently Chair of the Board of Directors of the Global Business School Network.

Mr. Dutta was previously the Chair of AACSB, the leading global body for the accreditation of business schools. He is a member of the Davos Circle, an association of long-time participants in the World Economic Forum Annual Meeting in Davos. He is also the co-chair of the World Economic Forum's Global Future Council on Innovation Ecosystems.

Mr. Dutta received a Bachelor of Technology in Electrical Engineering and Computer Science from the Indian Institute of Technology (IIT), New Delhi, a Master of Science in both Business Administration and Computer Science, and a PhD in Computer Science from the University of California at Berkeley. In 2017, he received the Distinguished Alumnus Award from his alma mater, IIT Delhi.

### **Rafael Escalona Reynoso**

Portulans Institute, CEO

Rafael Escalona Reynoso has been Senior Research Associate and Data Scientist for Portulans Institute since 2020. Before joining the Portulans Team he was the Lead Researcher at The Global Innovation Index (GII) from 2013 to 2020. He is a leader leveraging a unique combination of data and policy analysis and public relations skills plus an ability to influence long-term strategy by demonstrating thought leadership on project management.

His previous professional experience was as a member of the Trade and Foreign Investment Advisory Board at the office of the President of Mexico and as Economic, Science and

Technology Policy Advisor to the Senate of Mexico (LVIII Legislature). As part of the congressional advisory group he led research on the economic effects of international biosafety regulations on Mexico's basic research, industry, and trade and directed comparative analyses on international food and drug safety policies and regulations. These efforts assisted with the enactment of Mexico's biosafety of genetically modified organisms law (DOF 18-03-2005) and of the regulatory framework for Mexico's Federal Commission for Sanitary Risks (DOF-13-04-2004).

His research experience at Cornell University includes comparative studies between Mexico and Spain's National Systems of Innovation and regulatory aspects of modern biotechnology and the biosafety of genetically modified organisms (GMOs), and on the reach and scope of intellectual property rights (IPRs) in the information technologies era. He holds a PhD in Regional Planning with concentrations on Science and Technology Studies and Risk Analysis, Communication, and Policy and a Master of Public Administration with a concentration in Science, Technology, and Infrastructure Policy from Cornell University. He also holds a Bachelor of Arts in Economics from Universidad Panamericana in Mexico.

**Mariam Chaduneli**  
Project Manager

Mariam is a Policy Associate who has worked extensively on research and policy analysis in the area of technology policy, and digital rights, cybercrime and emerging threats. As the NRI 2021 Project Manager she has been in charge of monitoring relevant national and international policy developments and producing research content relating to digital readiness, innovation policy, and digital transformation. She has also been coordinating and managing communications, and administrative work across key workstream and stakeholders of the Network Readiness Index 2021.

Mariam has a master's degree in Innovation, Technology, and the Law from the University of Edinburgh focusing on the interplay of law, technology, and digital rights. Prior to obtaining the UK Government's Chevening Scholarship for her master's studies, she was a Chief Project Management Specialist in the Ministry of Internal

Affairs of Georgia where she gained hands-on experience initiating and managing international projects with public and private sector organizations operating on a national, regional and international level.

**Sylvie Antal**

Digital Strategy Manager

Sylvie is a Policy Research Associate with prior experience in digital privacy issues relating to minors and vulnerable populations, technology policy development research, and technology for international development. Prior to joining Portulans Institute, she spent time interning at the Family Online Safety Institute and the U.S. Federal Communications Commission, and was a Technology and Innovations writer for The Borgen Project.

Sylvie holds a Bachelor of Science in Information Science from the University of Michigan's School of Information, where she was a member of Tech for Social Good and an affiliate with The Center for Ethics, Society, and Computing. She is currently working towards completing her Masters degree in Human-Computer Interaction.

**Abdellah Bouhamidi**

Data Scientist

Abdellah is the Practice Leader at Sustainable Development Value Ltd., a consulting practice focused on Sustainable Growth Strategy. With a background in Operations Research, an MBA from Cornell University, and more than eight years of hands-on experience providing research and advisory services for strategy and investment executives, Abdellah Bouhamidi has helped 25 client organizations across 12 industries find and activate levers for growth.

Abdellah's work benefited corporate and governmental programs by bringing the advantage of technology and analytics to the table and drawing from the best practices of sustainability to identify quick wins and opportunities for impact that add incremental value toward the SDGs, on top of increasing the benefit to shareholders and client organizations.

## NRI's Technical Advisory Board (2021)

### Chris Ferguson

Chris Ferguson was a member of the original senior management team that built the UK's Government Digital Service. In 2011, he was brought into the Cabinet Office to take on the digital identity challenge and created the team that developed GOV.UK Verify. In January 2015, Chris became the GDS director responsible for the digital group comprising GOV.UK, GOV.UK Verify, and the Government-as-a-Platform delivery team. In February 2017, Chris established the National, International & Research Group within GDS. This will focus on how GDS engages and collaborates with the UK's wider public sector, devolved administrations, and partner organizations worldwide. Chris is the chair of the cross-government Digital Leaders network and head of the digital profession within HM Government. Prior to his involvement with the digital transformation of public services, Chris's career mainly focused on diplomacy and security in the UK and overseas.

### John Garrity

John Garrity is an economist, policy advisor, and program manager focusing on digital inclusion through pro-poor information and communications technology (ICT) policy and projects to foster universal Internet access and adoption. Currently he is an independent consultant to public sector and private sector organizations, including Connectivity Capital, a sector-focused investment management firm providing debt capital to Internet Service Providers (ISPs), UNDP as the technical advisor on a national rollout of free public WiFi in Southeast Asia, and with the UN Broadband Commission. Previously, John was the senior connectivity advisor in the Global Development Lab at USAID. Before USAID, John spent 10 years at Cisco, and prior to that, John was in the Corporate Strategy Group at the World Bank and held previous roles at the Federal Trade Commission and in state government. John has co-authored several reports on technology and development and has presented around the world on efforts to close the digital divide.

### **Elena Kvochko**

Elena Kvochko is Chief Trust Officer working in the field of cybersecurity and started with SAP in 2020. She is a former COO of cybersecurity technologies at Bank of America, CISSP, CEH. She also served as a technology, cybersecurity, and business operations executive. Kvochko is a Certified Information Security Professional (CISSP) and Certified Ethical Hacker (CEH). She was named one of the Top 100 CIOs and is a member of the Wall Street Journal CIO Council. Kvochko was named one of Fortune magazine's Most Powerful Women International, one of the "Leading CIOs Who Happen to Be Female" by CIO Magazine, and Business Role Model of the Year by Women in IT. She is also a published author and an inventor with patents pending in security, privacy, and digital payments technology.

### **Irene Mia**

Dr Mia is an experienced professional (economist by training) with a successful 20-year track-record in economic and policy research and on engaging with policy-makers and senior corporate leaders. Dr Mia has expertise in managing large teams with proven strategic, financial, planning and team building skills. Dr Mia holds a PHD in International Economic and Trade Law from L. Bocconi University and MA in Latin American studies from the Institute for Latin American Studies, London University. Before her recent appointment as Senior Fellow for Latin America at the International Institute for Strategic Studies (IISS), Dr Mia was the Global Editorial Director for Thought Leadership at Economist Group, Economist Intelligence Unit.

### **Andrew Puddephatt**

Andrew is the founder and director of Cedar Partners, a network of individuals working to improve life for all, and the founder and director of Adapt, a new startup helping companies manage user data ethically. Andrew also is the chair of the Internet Watch Foundation, which helps prevent child sex abuse online, board chair of the Board of Global Partners Digital, focusing on human rights implications of Internet policy, and deputy chair of the Sigrid Rausing Trust and management committee member of European Council of Foreign Relations.

### **Michaela Saisana**

Michaela Saisana is acting head of the Monitoring, Indicators and Impact Evaluation Unit, and she also leads the European Commission's Competence Centre on Composite Indicators and Scoreboards (COIN) at the Joint Research Centre in Italy. She has been working in the JRC since 1998, where she was awarded "best young scientist of the year" in 2004 and, along with her team, the "JRC policy impact award" for the Social Scoreboard of the European Pillar of Social Rights in 2018. As a scientist and engineer specializing in process optimization and spatial statistics, she collaborates, by auditing performance indices, with over 150 international organizations and world-class universities, including the United Nations, Transparency International, Oxfam, the World Economic Forum, INSEAD and WIPO. She is the author of about 30 articles in academic journals, 100 working papers, and a co-author of two books: 2008 OECD/JRC Handbook on Composite Indicators and 2008 Global Sensitivity Analysis-The Primer (Wiley).

## NRI's Advisory Board (2021)

### **Dr. Hessa Al-Jaber**

Dr. Hessa Al-Jaber is the chairperson of Trio Investment, a technology investment company that invests in innovative technology that addresses some of the most pressing health problems in the MENA region. As an expert in technology, media, and telecom practice, her focus is the impact of a digital economy in productivity and competitiveness. Dr. Hessa was the former and the first-ever Minister of Information and Communication Technology in Qatar. Prior to becoming a minister, Dr. Hessa held the position of Secretary General of the Supreme Council of Information and Communication Technology since its inception in 2005. Dr. Al Jaber was a member of United Nations ITU Broadband Commission for Sustainable development and a member at the Network of Global Agenda Councils of the World Economic Forum (WEF). Dr. Al Jaber is currently the Chairperson of Qatar Satellite Company, and Malomatia, in addition to being a member of several boards including Volkswagen (AG) Supervisory Board in Germany, Qatar University's Board of Regents, Qatar Museums Authority's Board. Dr. Hessa holds a Bachelor of Science in Engineering from Kuwait University, and a Master's Degree and Ph.D in Computer Science from George Washington University, Washington, DC.

### **Dr. Tawfik Jelassi**

Tawfik Jelassi was recently appointed as an Assistant-Director General at UNESCO. He is a Professor of Strategy and Technology Management at IMD Business School in Lausanne (Switzerland). He is also Co-Director of the "Orchestrating Winning Performance" program in Lausanne, Singapore and Dubai, which is IMD's signature program and its biggest executive education offering (with more than 650 participants enrolled in it annually). Before joining IMD, Dr. Jelassi was Minister of Higher Education, Scientific Research, and Information & Communication Technologies in the post-Arab Spring Tunisian Government, which was mandated to finalize the democratic transition in the country. Dr. Jelassi was Chairman of the Board of Directors of Ooredoo Tunisia, the leading mobile telecom operator in the country. Between 2000 and 2013, he was Professor and Dean of

the Business School of Ecole Nationale des Ponts et Chaussées in Paris (the oldest Grande Ecole of France). Prior to that, he was Associate Professor and Coordinator of the Technology Management academic area at INSEAD, Fontainebleau. Dr. Jelassi holds a Ph.D. degree in Management Information Systems (MIS) from the Stern School of Business at New York University (USA).

### **Diego Molano**

Diego Molano is an international consultant on digital transformation of companies and governments. He was the minister of information and communication technologies (ICT) of Colombia from 2010 to 2015. He transformed his country with his policy plan “Vive Digital,” which aims to reduce poverty and create jobs using technology. Mr. Molano has a long career in the technology industry and has had responsibilities in more than 20 countries. He has been a board member of international organizations and corporations in the telecommunications, TV, radio, and postal services sectors. He is currently senior advisor to the Inter-American Development Bank, senior advisor to McKinsey & Co. in Washington DC. Mr. Molano is an electronics engineer and economist from Xavier University in Colombia and holds an MBA from IMD in Switzerland.

### **Osman Sultan**

Osman Sultan brings 35 years of leadership, rich with achievements in the telecom sector. His vast knowledge and expertise in the field as early as the pre-Internet period placed him as one of the pioneers in Europe, the US, Japan, and the entire MENA region. His distinguished achievements ranked him as one of the most powerful executives in the worldwide telecom industry twice on the “GTBPower100 List” in both 2010 and 2011. Sultan has developed several strategies that helped produce the profound transformations that the telecom and information sectors have been creating in our lives. Sultan has been a board member for various institutions in the telecom industry, technology space, and academic world. incl. the advisory board of the Mohammed bin Rashid School of Communications (MBRSC), the Global Blockchain Advisory Council of the WEF, the Board of Endeavor UAE, and many others.

## About the Network Readiness Index

The 2021 NRI is the third edition of a renewed NRI model, and it ranks a total of 130 economies based on their performance across 60 variables. This year's edition offers a review of the effects of the COVID-19 pandemic on the pace and depth of digital transformation. Although it is early to predict the full impact of this digital acceleration, the report provides a first glance at its impact on governments, businesses, and individuals.

Recognizing the pervasiveness of digital technologies in today's networked world, the index is grounded in four fundamental dimensions: Technology, People, Governance, and Impact. This holistic approach means that the NRI covers issues ranging from future technologies such as AI and the Internet of Things to the role of the digital economy in reaching the Sustainable Development Goals (SDGs).

Origins: The Network Readiness Index (NRI) was first published in 2002 and provided a holistic framework for assessing the multi-faceted impact of ICT on society and the development of nations. Until 2016, the NRI was part of the Global Information Technology Report (GITR) published by the World Economic Forum (WEF), Cornell University, and INSEAD. The NRI anticipated various aspects that would become critical in the following years. Early on, it identified three essential stakeholders for ICT: individuals/society, businesses, and governments, and it included elements of ICT application that were novel for the time.

At a time when the primary concerns in ICT revolved around infrastructure issues, the NRI provided a forward-looking and holistic perspective on the application of ICT within national economies. The NRI rapidly developed into a global benchmark for the application and utilization of ICT. Many economies utilized the NRI to design their ICT strategies, and the NRI was used and frequently quoted by leaders from the public and private sectors.

In a major redesign of the NRI framework in 2019, current topical concerns of trust, governance, inclusivity and impact on SDG goals were included into the model. The NRI framework provides a simple yet holistic view of how economies can leverage the power of digital technologies while building sustainable and inclusive futures.

This year, the renewed and revised NRI covers 130 nations across over 60 indicators and is a publication of the Portulans Institute, whose co-founders—Bruno Lanvin and Soumitra Dutta—have also been the co-editors of the GITR in previous years.

All editions of the NRI are available at
